Rozovskii,1996-03-28 The study of the ocean is almost as old as the history of mankind itself When the first seafarers set out in their primitive ships they had to understand as best they could tides and currents eddies and vortices for lack of understanding often led to loss of live These primitive oceanographers were of course primarily statisticians They collected what empirical data they could and passed it down ini tially by word of mouth to their descendants Data collection continued throughout the millenia and although data bases became larger more re liable and better codified it was not really until surprisingly recently that mankind began to try to understand the physics behind these data and shortly afterwards to attempt to model it The basic modelling tool of physical oceanography is today the partial differential equation Somehow we all know that if only we could find the right set of equations with the right initial and boundary conditions then we could solve the mysteries of ocean dynamics once and for all **Séminaire de Probabilités XXXVIII** Michel Émery,Michel Ledoux,Marc Yor,2004-11-15 Besides a series of six articles on L vy processes Volume 38 of the S minaire de Probabilit s contains contributions whose topics range from analysis of semi groups to free probability via martingale theory Wiener space and Brownian motion Gaussian processes and matrices diffusions and their applications to PDEs As do all previous volumes of this series it provides an overview on the current state of the art in the research on stochastic processes **Handbook of Measure Theory** E. Chung,Zhongxin Zhao,2012-12-06 In recent years the study of the theory of Brownian motion has become a powerful tool in the solution of problems in mathematical physics This self contained and readable exposition by leading authors provides a rigorous account of the subject emphasizing the explicit rather than the concise where necessary and addressed to readers interested in probability theory as applied to analysis and mathematical physics A distinctive feature of the methods used is the ubiquitous appearance of stopping time The book contains much original research by the authors some of which published here for the first time as well as detailed and improved versions of relevant important results by other authors not easily accessible in existing literature High Dimensional Probability II Evarist Giné,David M. that encompasses the topics rep resented in this volume began about thirty years ago with research in two related areas limit theorems for sums of independent Banach space valued random vectors and general Gaussian processes An important feature in these past research studies has been the fact that they highlighted the es sential probabilistic nature of the problems considered In part this was because by working on a general Banach space one had to discard the extra and often extraneous structure imposed by random variables taking values in a Euclidean space or by processes being indexed by sets in R or Rd Doing this led to striking advances particularly in Gaussian process theory It also led to the creation or introduction of powerful new tools such as randomization decoupling moment and exponential inequalities chaining isoperimetry and concentration of measure which apply to areas well beyond those for which they were created The general theory of em pirical processes with its vast applications in statistics the study of local times of Markov processes certain problems in harmonic analysis and the general theory of stochastic processes are just several of the broad areas in which Gaussian process techniques and techniques from probability in Banach spaces have made a substantial impact Parallel to this work on probability in Banach spaces classical proba bility and empirical process theory were enriched by the development of powerful results in strong approximations *Seminaire de Probabilites XXXIV* J. Azema,M. Emery,M. Ledoux,M. Yor,2007-05-06 This volume contains 19 contributions to various subjects in the theory of commutative and non commutative stochastic processes It also provides a 145 page graduate course on branching and interacting particle systems with applications to non linear filtering by P del Moral and L Miclo *Fractal Geometry and Stochastics* Christoph Bandt,Siegfried Graf,Martina Zähle,2013-11-27 Fractal geometry is a new and promising field for researchers from different disciplines such as mathematics physics chemistry biology and medicine It is used to model complicated natural and technical phenomena The most convincing models contain an element of randomness so that the combination of fractal geometry and stochastics arises in between these two fields It contains contributions by outstanding mathematicians and is meant to highlight the principal directions of research in the area The contributors were the main speakers attending the conference Fractal Geometry and Stochastics held at Finsterbergen Germany in June 1994 This was the first international conference ever to be held on the topic The book is addressed to mathematicians and other scientists who are interested in the mathematical theory concerning Fractal sets and measures Iterated function systems Random fractals Fractals and dynamical systems and Harmonic analysis on fractals The reader will be introduced to the most recent results in these subjects Researchers and graduate students alike will benefit from the clear expositions A Guide to First-Passage Processes Sidney Redner,2001-08-06 The basic theory presented in a way which emphasizes intuition problem solving and the connections with other fields Markov Processes, Gaussian Processes, and Local Times Michael B. Marcus,Jay Rosen,2006-07-24 A readable 2006 synthesis of three main areas in the modern theory of stochastic processes
