Wolfgang Becker, 2005-12-19 In 1984 Desmond O Connor and David Phillips published their comprehensive book Time correlated Single Photon Counting At that time time correlated single photon counting or TCSPC was used primarily to record fluorescence decay functions of dye solutions in cuvettes From the beginning TCSPC was an amazingly sensitive and accurate technique with excellent time resolution However acquisition times were relatively slow due to the low repetition rate of the light sources and the limited speed of the electronics of the 70s and early 80s Moreover TCSPC was intrinsically one dimensional i.e. limited to the recording of the waveform of a periodic light signal Even with these limitations it was a wonderful technique More than 20 years have elapsed and electronics and laser techniques have made impressive progress The number of transistors on a single chip has approximately doubled every 18 months resulting in a more than 1 000 fold increase in complexity and speed The repetition rate and power of pulsed light sources have increased by about the same factor
