Huntington's Disease Gillian Bates, Peter S. Harper, Lesley Jones, 2002 It is now almost a decade since the identification of the Huntington's Disease gene and its mutation. Major advances in our understanding of the disorder have been made during this time. Since publication of the first two editions much more extensive evidence exists on how the HD mutation actually causes brain pathology. Experimental tools are now available to take this research further towards new therapeutic approaches. Due to these major changes this well established book has been radically updated. An international group of leaders in their particular fields cover the major recent advances in the genetics and neurobiology of the disease. Developments in our understanding of how the molecular basis of the disorder results in brain degeneration with full coverage of transgenic animal models, neurochemical studies and advances in neuropathology are discussed in detail. The clinical sections cover both neurological and psychiatric aspects as well as new developments in therapy. This book will continue to provide an invaluable source of information for clinicians and scientists involved with Huntington's Disease including geneticists, psychiatrists and neurologists and basic research workers in genetics and neurobiology.

Food Toxicology Debasis Bagchi, Anand Swaroop, 2016-11-25 Food toxicology studies how natural or synthetic poisons and toxicants in diverse food products cause harmful, detrimental or adverse side effects in living organisms. Food toxicology is an important consideration as the food supply chain is becoming more multinational in origin and any contamination or toxic manifestation may cause serious, wide spread adverse health effects. Food Toxicology covers various aspects of food safety and toxicology including the study of the nature, properties, effects and detection of toxic substances in food and their disease manifestations in humans. It will also include other aspects of consumer product safety. The first two chapters discuss the measurement of toxicants and toxicity and the importance of dose response in food toxicology. Additional chapters discuss the aspects of food associated carcinogenesis and food derived chemical carcinogenesis, food allergy, pathogens associated with fruits and vegetables and the detrimental effects of radionuclides exposure. The chapters also cover the most important heavy metal contaminants, namely mercury, lead and vanadium and fluoride toxicity which is extensively discussed in its own chapter. Toxicologists, scientists, researchers in food toxicology, nutritionists and public health care professionals will find valuable information in this book on all possible intricate areas of food toxicology.

Modern Techniques in Neuroscience Research Uwe Windhorst, Hakan Johansson, 2012-12-06 Nothing tends so much to the advancement of knowledge as the application of a new instrument. Sir Humphry Davy 1778-1829 Neuroscience has become a rapidly expanding endeavor that relies on a number of

other sciences such as mathematics physics chemistry engineering computer science general biology and medicine genetics etc In fact many of its recent successes result from the application of ideas and methods borrowed from these fields Insofar it is a true interdisciplinary undertaking This convergence of influences accounts for part of its enormous attractiveness and fascination to students and researchers from diverse walks of life or science for that matter It is probably fair to say that a great number of neuroscience's most creative and productive proponents have been lured into this field not only by the excitement about the possibility to unmask the secrets of the human mind but also by the appeal of a vast unknown land needing cultivation and tools to cultivate it Danger may arise for any science if it is dominated by methods and techniques of investigation rather than by problems to be solved and concepts to be developed This might concentrate efforts onto the technically feasible and doable rather than on the real issues But on the other hand especially the young and growing sciences are heavily dependent on the development and application of methods often even before a problem relying on these methods may become apparent

Animal-friendly methods for rodent behavioral testing in neuroscience research Raffaele d'Isa,Stefania Fasano,Riccardo Brambilla,2024-07-03 Rodent behavioral testing has been used to study brain functions since the 1890s and has become a gold standard model in modern neuroscience Up to the 1950s most behavioral tests on laboratory rodent models were based on punishments and rewards Both approaches can lead to a certain degree of animal pain or suffering Punishments involved the employment of painful stimuli typically electric shocks Passive avoidance and fear conditioning tests among the most widely used behavioral paradigms used to evaluate learning and memory in rodents can be performed using only a single brief shock Other tests such as the active avoidance might require up to tens or hundreds of shocks strongly challenging the psychological welfare of the model animals On the other hand tests based on rewards which apparently may seem more ethical actually still induce suffering in the animals as food rewards are almost always associated with a food restriction protocol in order to motivate food seeking behavior Rodents are starved for days before starting the test and kept under food restriction for the whole duration of the test The distress during the testing session is only a minimal part compared to the stress lived outside of the testing session which is prolonged and continuous Analogously liquid rewards commonly rely on a previous water restriction protocol to use thirst as motivation Animal stress is not only an ethical issue per se but also an important factor potentially impacting on the reliability and reproducibility of experimental results
