

# Self-Healing Methods

## **Hollow Tube Method**

Capillaries or fibers are imbedded in a composite material. The resulting porous network is filled with monomer. When damage occurs, the tubes crack and the monomer is released into cracks. Other tubes containing a hardening agent also crack and mix with the monomer, causing the crack to be healed.

## **Microcapsule Method**

Monomer is encapsulated and embedded within the thermosetting polymer. When a crack reaches the microcapsule, the capsule breaks and the monomer enters the crack, where it can polymerize and mend the crack.

## **Material Design**

Reactivity

- reactivity of the catalyst must be maintained even after it is encapsulated

Viscosity

- monomer must flow at a sufficient rate and have appropriate viscosity to cover the entire crack before it is polymerized

Kinetics

- catalyst must quickly dissolve into monomer in order to react efficiently and prevent the crack from spreading further
