*Methods on Physico-chemical Analysis of Fruits* Bibhas Chandra Mazumdar, K. Majumder, 2021      *Methods on Physico Chemical Analysis of Fruits* Mazumdar, 2003

Analysis of human consumable fruits become necessary to the students and researchers of fruit science horticulture food technology plant biochemistry botany applied botany forestry ayurved pharmaceutics and some other disciplines. Necessity of such analysis is also felt in fruit preservation factories or training centres and to the agricultural marketing personnels in making grading of fruits. It needs pointing out in this context that to assess the quality and nutritive status or compositional features of a fruit not only the chemical constituents but many physical components of it also become necessary to be determined. There are in fact a number of books available which have presented the analytical procedure of plant materials and some of these have considered fruit analysis also as a part. These titles have though presented much details and put up several procedure for a component methodology to assess physical components of fruits has hardly received adequate attention. Therefore a practical manual on fruit analysis that would exclusively deal on procedural detail of both physical and chemical components of fruits cannot be set at defiance especially as a number of characteristic features specific to any species or variety of a fruit sometimes need to be critically considered in a fruit analytical procedure. Keeping the above facts in view the present title has been attempted. Many of the physical methods of analysis have in fact been devised by the principal author in his teaching and research career over three decades. The title has before entering into chemical analytical part discussed some fundamental aspects of such analysis and the procedure appeared to be much convenient in estimating a component chemically has been presented.

Application of Analytical Chemistry to Foods and Food Technology Daniele Naviglio, Monica Gallo, 2021-02-22 The application of analytical chemistry to the food sector allows the determination of the chemical composition of foods and the properties of their constituents contributing to the definition of their nutritional and commodity value Furthermore it is possible to study the chemical modifications that food constituents undergo as a result of the treatments they undergo food technology Food analysis therefore allows us not

only to determine the quality of a product or its nutritional value but also to reveal adulterations and identify the presence of xenobiotic substances potentially harmful to human health Furthermore some foods especially those of plant origin contain numerous substances with beneficial effects on health While these functional compounds can be obtained from a correct diet they can also be extracted from food matrices for the formulation of nutraceutical products or added to foods by technological or biotechnological means for the production of functional foods On the other hand the enormous growth of the food industry over the last 50 years has broadened the field of application of analytical chemistry to encompass not only food but also food technology which is fundamental for increasing the production of all types of food      **Toxicology Research**
