Applicable Differential Geometry M. Crampin,F. A. E. Pirani,1986 An introduction to geometrical topics used in applied mathematics and theoretical physics   **Dictionary of Distances** Michel-Marie Deza,Elena Deza,2006-11-16 This book comes out of need and urgency expressed especially in areas of Information Retrieval with respect to Image Audio Internet and Biology to have a working tool to compare data The book will provide powerful resource for all researchers using Mathematics as well as for mathematicians themselves In the time when over specialization and terminology fences isolate researchers this Dictionary try to be centripedal and oikoumeni providing some access and altitude of vision but without taking the route of scientific vulgarisation This attempted balance is the main philosophy of this Dictionary which defined its structure and style Key features Unicity it is the first book treating the basic notion of Distance in whole generality Interdisciplinarity this Dictionary is larger in scope than majority of thematic dictionaries Encyclopedicity while an Encyclopedia of Distances seems now too difficult to produce this book by its scope short introductions and organization provides the main material for it and for future tutorials on some parts of this material Applicability the distances as well as distance related notions and paradigms are provided in ready to use fashion Worthiness the need and urgency for such dictionary was great in several huge areas esp Information Retrieval Image Analysis Speech Recognition and Biology Accessibility the definitions are easy to locate by subject or in Index by alphabetic order the introductions and definitions are reader friendly and maximally independent one from another still the text is structured in the 3D HTML style by hyperlink like boldfaced references to similar definitions Covers a large range of subjects in pure and applied mathematics Designed to be easily applied the distances and distance related notions and paradigms are ready to use Helps users quickly locate definitions by subject or in alphabetical order stand alone entries include references to other entries and sources for further investigation   **Foundations of Measurement** Patrick Suppes,2014-06-28 Foundations of Measurement offers the most coherently organized treatment of the topics and issues central to measurement Much of the research involved has been scattered over several decades and a multitude of journals available in many instances only to specialties With the publication of Volumes two and three of this important work Foundations of Measurement is the most comprehensive presentation in the area of measurement   **Projective Geometry and Projective Metrics** ,2011-08-29 Projective Geometry and Projective Metrics   *Encyclopedia of Distances* Michel Marie Deza,Elena Deza,2016-08-16 This 4 th edition of the leading reference volume on distance metrics is characterized by updated and rewritten sections on some items suggested by experts and readers as well a general streamlining of content and the addition of essential new topics Though the structure remains unchanged the new edition also explores recent advances in the use of distances and metrics for e g generalized distances probability theory graph theory coding theory data analysis New topics in the purely mathematical sections include e g the Vitanyi multiset metric algebraic point conic distance triangular ratio metric Rossi Hamming metric

Taneja distance spectral semimetric between graphs channel metrization and Maryland bridge distance The multidisciplinary sections have also been supplemented with new topics including dynamic time wrapping distance memory distance allometry atmospheric depth elliptic orbit distance VLBI distance measurements the astronomical system of units and walkability distance Leaving aside the practical questions that arise during the selection of a good distance function this work focuses on providing the research community with an invaluable comprehensive listing of the main available distances As well as providing standalone introductions and definitions the encyclopedia facilitates swift cross referencing with easily navigable bold faced textual links to core entries In addition to distances themselves the authors have collated numerous fascinating curiosities in their Who s Who of metrics including distance related notions and paradigms that enable applied mathematicians in other sectors to deploy research tools that non specialists justly view as arcane In expanding access to these techniques and in many cases enriching the context of distances themselves this peerless volume is certain to stimulate fresh research   Tensor Geometry C. T. J. Dodson,Timothy Poston,2013-04-17 This treatment of differential geometry and the mathematics required for general relativity makes the subject of this book accessible for the first time to anyone familiar with elementary calculus in one variable and with a knowledge of some vector algebra   *Classical and Geometrical Theory of Chemical and Phase Thermodynamics* Frank Weinhold,2009-02-17 Because it is grounded in math chemical thermodynamics is often perceived as a difficult subject and many students are never fully comfortable with it The first authoritative textbook presentation of equilibrium chemical and phase thermodynamics in a reformulated geometrical framework Chemical and Phase Thermodynamics shows how this famously difficult subject can be accurately expressed with only elementary high school geometry concepts Featuring numerous suggestions for research level extensions this simplified alternative to standard calculus based thermodynamics expositions is perfect for undergraduate and beginning graduate students as well as researchers   **Chemical Cosmology** Jan C. A. Boeyens,2010-09-02 The composition of the most remote objects brought into view by the Hubble telescope can no longer be reconciled with the nucleogenesis of standard cosmology and the alternative explanation in terms of the Cold Dark Matter model has no recognizable chemical basis A more rational scheme based on the chemistry and periodicity of atomic matter opens up an exciting new interpretation of the cosmos in terms of projective geometry and general relativity The response of atomic structure to environmental pressure predicts non Doppler cosmical redshifts and equilibrium nucleogenesis by particle addition in accord with observed periodic variation of nuclear abundance Inferred cosmic self similarity elucidates the Bode Titius law general commensurability in the solar system and the occurrence of quantum phenomena on a cosmic scale The generalized periodic function involves both matter and anti matter in an involuted mapping to a closed projective plane This topology ensures the same symmetrical balance in a chiral universe wrapped around an achiral vacuum interface without singularities A new cosmology emerges based on the theory of projective relativ ity presented here as a translation of Veblen s original German text Not only does it provide a

unification of gravity electromagnetism and quantum theory through gauge invariance but also supports the solution of the gravitational field equations obtained by G del for a rotating universe The appearance of an Einstein Rosen bridge as outlet from a black hole into conjugate anti space accounts for globular clusters quasars cosmic radiation ray bursters pulsars radio sources and other re gions of plasma activity The effects of a multiply connected space time manifold on observa tions in an Euclidean tangent space are unpredictable and a complete re assessment of the size and structure ofthe universe is indicated The target readership includes scientists as well as non scientists everybody with a scientific or philosophical interest in cosmology and especially those cosmologists and mathematicians with the ability to recast the crude ideas presented here into appropriate mathematical models   Mathematics Aleksandr Danilovich Aleksandrov,Andre? Nikolaevich Kolmogorov,M. A. Lavrent'ev,1999-01-01 Major survey offers comprehensive coherent discussions of analytic geometry algebra differential equations calculus of variations functions of a complex variable prime numbers linear and non Euclidean geometry topology functional analysis more 1963 edition   **Felix Klein** David E. Rowe,2025-05-29 This book presents a historical account of Felix Klein s Comparative Reflections on Recent Research in Geometry 1872 better known as his Erlangen Program Originally conceived and written when Klein was collaborating with Sophus Lie this bold essay initially made little impression on contemporary researchers Decades later however it eventually became a famous classic Eminent mathematicians hailed Klein s main message the role of invariants of transformation groups in geometry as presaging major developments in mathematics and physics The first part of this book focuses on the prehistory surrounding Klein s Erlangen Program stressing the motivations that led Klein to write it The core of the book Part II then presents a new translation of Klein s original text followed by detailed textual analysis aimed at guiding the reader through its rather terse and opaque prose Part III deals with its complicated reception history treated in four periods spanning the years from 1872 to 1930 This culminated during Klein s lifetime with his efforts to promote the Erlangen Program as a framework for interpreting Einstein s theory of relativity After his death in 1925 the viability of this framework became a contentious issue among leading differential geometers Part IV looks back on the transformations in mathematics that led to a modernized interpretation of Klein s message The book also explores in depth how the growing fame of the Erlangen Program undermined Klein s friendship with Sophus Lie leading to a dramatic public break between them in 1893 Beyond the Erlangen Program itself this book deals with many of Felix Klein s other works As an introduction to a largely forgotten world of ideas this study will appeal not only to experts but also to graduate students and all those with a serious interest in the history of modern mathematics   *Berkovich Spaces and Applications* Antoine Ducros,Charles Favre,Johannes Nicaise,2014-11-21 We present an introduction to Berkovich s theory of non archimedean analytic spaces that emphasizes its applications in various fields The first part contains surveys of a foundational nature including an introduction to Berkovich analytic spaces by M Temkin and to tale cohomology by A Ducros as well as a short note by C Favre on the topology of some Berkovich spaces The second

part focuses on applications to geometry A second text by A Ducros contains a new proof of the fact that the higher direct images of a coherent sheaf under a proper map are coherent and B R my A Thuillier and A Werner provide an overview of their work on the compactification of Bruhat Tits buildings using Berkovich analytic geometry The third and final part explores the relationship between non archimedean geometry and dynamics A contribution by M Jonsson contains a thorough discussion of non archimedean dynamical systems in dimension 1 and 2 Finally a survey by J P Otal gives an account of Morgan Shalen s theory of compactification of character varieties This book will provide the reader with enough material on the basic concepts and constructions related to Berkovich spaces to move on to more advanced research articles on the subject We also hope that the applications presented here will inspire the reader to discover new settings where these beautiful and intricate objects might arise   *Nearly Pseudo-Kähler Manifolds and Related Special Holonomies* Lars Schäfer,2017-09-14 Developing and providing an overview of recent results on nearly K hler geometry on pseudo Riemannian manifolds this monograph emphasizes the differences with the classical Riemannian geometry setting The focal objects of the text are related to special holonomy and Killing spinors and have applications in high energy physics such as supergravity and string theory Before starting into the field a self contained introduction to the subject is given aimed at students with a solid background in differential geometry The book will therefore be accessible to masters and Ph D students who are beginning work on nearly K hler geometry in pseudo Riemannian signature and also to non experts interested in gaining an overview of the subject Moreover a number of results and techniques are provided which will be helpful for differential geometers as well as for high energy physicists interested in the mathematical background of the geometric objects they need   **Propagating Terraces and the Dynamics of Front-Like Solutions of Reaction-Diffusion Equations on R** Peter Poláčik,2020-05-13 The author considers semilinear parabolic equations of the form ut uxx f u x R t 0 where f a C1 function Assuming that 0 and 0 are constant steady states the author investigates the large time behavior of the front like solutions that is solutions u whose initial values u x 0 are near for x and near 0 for x If the steady states 0 and are both stable the main theorem shows that at large times the graph of u t is arbitrarily close to a propagating terrace a system of stacked traveling fonts The author proves this result without requiring monotonicity of u 0 or the nondegeneracy of zeros of f The case when one or both of the steady states 0 is unstable is considered as well As a corollary to the author s theorems he shows that all front like solutions are quasiconvergent their limit sets with respect to the locally uniform convergence consist of steady states In the author s proofs he employs phase plane analysis intersection comparison or zero number arguments and a geometric method involving the spatial trajectories u x t ux x t x R t 0 of the solutions in question   **Nonlinear Elastic and Inelastic Models for Shock Compression of Crystalline Solids** John D. Clayton,2019-05-17 This book describes thermoelastic and inelastic deformation processes in crystalline solids undergoing loading by shock compression Constitutive models with a basis in geometrically nonlinear continuum mechanics supply these descriptions Large

deformations such as finite strains and rotations are addressed The book covers dominant mechanisms of nonlinear thermoelasticity dislocation plasticity deformation twinning fracture flow and other structure changes Rigorous derivations of theoretical results are provided with approximately 1300 numbered equations and an extensive bibliography of over 500 historical and modern references spanning from the 1920s to the present day Case studies contain property data as well as analytical and numerical solutions to shock compression problems for different materials Such materials are metals ceramics and minerals single crystalline and polycrystalline The intended audience of this book is practicing scientists physicists engineers materials scientists and applied mathematicians involved in advanced research on shock compression of solid materials **Global Well-Posedness of High Dimensional Maxwell–Dirac for Small Critical Data** Cristian Gavrus,Sung-Jin Oh,2020-05-13 In this paper the authors prove global well posedness of the massless Maxwell Dirac equation in the Coulomb gauge on R1 d d 4 for data with small scale critical Sobolev norm as well as modified scattering of the solutions Main components of the authors proof are A uncovering null structure of Maxwell Dirac in the Coulomb gauge and B proving solvability of the underlying covariant Dirac equation A key step for achieving both is to exploit and justify a deep analogy between Maxwell Dirac and Maxwell Klein Gordon for which an analogous result was proved earlier by Krieger Sterbenz Tataru which says that the most difficult part of Maxwell Dirac takes essentially the same form as Maxwell Klein Gordon Subgroup Decomposition in Out(Fn) Michael Handel,Lee Mosher,2020-05-13 In this work the authors develop a decomposition theory for subgroups of Out Fn which generalizes the decomposition theory for individual elements of Out Fn found in the work of Bestvina Feighn and Handel and which is analogous to the decomposition theory for subgroups of mapping class groups found in the work of Ivanov *Sums of Reciprocals of Fractional Parts and Multiplicative Diophantine Approximation* Victor Beresnevich,Alan Haynes,Sanju Velani,2020-04-03 **The Bounded and Precise Word Problems for Presentations of Groups** S. V. Ivanov,2020-05-13 The author introduces and studies the bounded word problem and the precise word problem for groups given by means of generators and defining relations For example for every finitely presented group the bounded word problem is in NP i e it can be solved in nondeterministic polynomial time and the precise word problem is in PSPACE i e it can be solved in polynomial space The main technical result of the paper states that for certain finite presentations of groups which include the Baumslag Solitar one relator groups and free products of cyclic groups the bounded word problem and the precise word problem can be solved in polylogarithmic space As consequences of developed techniques that can be described as calculus of brackets the author obtains polylogarithmic space bounds for the computational complexity of the diagram problem for free groups for the width problem for elements of free groups and for computation of the area defined by polygonal singular closed curves in the plane The author also obtains polynomial time bounds for these problems *A Unified Approach to Structural Limits and Limits of Graphs with Bounded Tree-Depth* Jaroslav Nešetřil,Patrice Ossona de Mendez,2020-04-03 In this paper the authors introduce a general framework for the

study of limits of relational structures and graphs in particular which is based on a combination of model theory and functional analysis The authors show how the various approaches to graph limits fit to this framework and that the authors naturally appear as tractable cases of a general theory As an outcome of this the authors provide extensions of known results The authors believe that this puts these into a broader context The second part of the paper is devoted to the study of sparse structures First the authors consider limits of structures with bounded diameter connected components and prove that in this case the convergence can be almost studied component wise They also propose the structure of limit objects for convergent sequences of sparse structures Eventually they consider the specific case of limits of colored rooted trees with bounded height and of graphs with bounded tree depth motivated by their role as elementary bricks these graphs play in decompositions of sparse graphs and give an explicit construction of a limit object in this case This limit object is a graph built on a standard probability space with the property that every first order definable set of tuples is measurable This is an example of the general concept of modeling the authors introduce here Their example is also the first intermediate class with explicitly defined limit structures where the inverse problem has been solved   *The Triangle-Free Process and the Ramsey Number R(3,k)* Gonzalo Fiz Pontiveros,Simon Griffiths,Robert Morris,2020-04-03 The areas of Ramsey theory and random graphs have been closely linked ever since Erd s s famous proof in 1947 that the diagonal Ramsey numbers R k grow exponentially in k In the early 1990s the triangle free process was introduced as a model which might potentially provide good lower bounds for the off diagonal Ramsey numbers R 3 k In this model edges of Kn are introduced one by one at random and added to the graph if they do not create a triangle the resulting final random graph is denoted Gn In 2009 Bohman succeeded in following this process for a positive fraction of its duration and thus obtained a second proof of Kim s celebrated result that R 3 k k2 logk In this paper the authors improve the results of both Bohman and Kim and follow the triangle free process all the way to its asymptotic end
