Cheng, Uwe Aßmann, 2014-07-05 Traditionally research on model driven engineering MDE has mainly focused on the use of models at the design implementation and verification stages of development This work has produced relatively mature techniques and tools that are currently being used in industry and academia However software models also have the potential to be used at runtime to monitor and verify particular aspects of runtime behavior and to implement self capabilities e.g adaptation technologies used in self healing self managing self optimizing systems A key benefit of using models at runtime is that they can provide a richer semantic base for runtime decision making related to runtime system concerns associated with autonomic and adaptive systems This book is one of the outcomes of the Dagstuhl Seminar 11481 on models run time held in November December 2011 discussing foundations techniques mechanisms state of the art research challenges and applications for the use of runtime models The book comprises four research roadmaps written by the original participants of the Dagstuhl Seminar over the course of two years following the seminar and seven research papers from experts in the area The roadmap papers provide insights to key features of the use of runtime models and identify the following research challenges the need for a reference architecture uncertainty tackled by runtime models mechanisms for leveraging runtime models for self adaptive software and the use of models at runtime to address assurance for self adaptive systems
