This proceedings volume of the 5th AOIS Workshop is an opportunity for looking back at ve years of organizing AOIS workshops What did we achieve with the AOIS workshop series Where were we ve years ago where are we now Did

our theme impact on the information systems eld in the way that we had hoped for AOIS workshops have taken place in Seattle Heidelberg Stockholm Austin Montr eal Interlaken Toronto Bologna Melbourne and Chicago always in conjunction with a major conference on either multiagent systems in artificial intelligence AI MAS or information systems IS We have tried to innovate in holding these workshops as biconference events each year AOIS held two workshop events one at an AI MAS conference and one at an IS conference as well as using the AOIS web site as a medium for communication among researchers So certainly we have reached a wide audience of researchers around the world from both the AI MAS and IS communities But did we also manage to build up a dedicated AOIS community Five years ago we wrote Agent concepts could fundamentally alter the nature of information systems of the future and how we build them much like structured analysis ER modeling and Object Orientation has precipitated fundamental changes in IS practice Of course a period of ve years is too short for evaluating the success or failure of a new scientific paradigm But still we may observe that while most IS conferences meanwhile list agents as one of their many preferred topics agent orientation is generally not considered to be a fundamental IS paradigm

### **Human-Centered Software Engineering** Ahmed Seffah, Jean Vanderdonckt, Michel C.

Desmarais, 2009-06-19 Activity theory is a way of describing and characterizing the structure of human activity of all kinds First introduced by Russian psychologists Rubinshtein Leontiev and Vigotsky in the early part of the last century activity theory has more recently gained increasing attention among interaction designers and others in the human computer interaction and usability communities see for example Gay and H Brooke 2004 Interest was given a significant boost when Donald Norman suggested activity theory and activity centered design as antidotes to some of the putative ills of human centered design Norman 2005 Norman who has been credited with coining the phrase user centered design suggested that too much attention focused on human users may be harmful that to design better tools designers need to focus not so much on users as on the activities in which users are engaged and the tasks they seek to perform within those activities Although many researchers and practitioners claim to have used or been influenced by activity theory in their work see for example Nardi 1996 it is often difficult to trace precisely where or how the results have actually been shaped by activity theory In many cases even detailed case studies report results that seem only distantly related if at all to the use of activity theory Contributing to the lack of precise and traceable impact is that activity theory spite its name is not truly a formal and proper theory
