INTRODUCTION: Layer Beam Melting (LBM) is an Additive Manufacturing process based on the interaction between a laser beam and a metallic powder bed. Understanding the associated physical phenomena is necessary to control the process in an industrial context. Particularly, metal vaporisation induces collateral effects as denudation¹ (Figure 1) which might be detrimental to the process. The present work proposes a multi-physical two-phase flow model of metal vaporisation under static laser irradiation.

Figure 1 Principle of LBM.

Figure 2 Static laser shot configuration.

COMPUTATIONAL METHODS: Using a double domain ALE approach allows coupling two fluid flows with different natures. A compressible high Mach number flow in the gas side – coupled with heat transfer and chemical species transport – and an incompressible low Mach number flow in the metal phase – coupled with heat transfer. The interface is handle with an ALE algorithm (Figure 2).

RESULTS

Figure 3 Melt pool shape, gas velocity field and streamlines (left), melt pool temperature field and fraction of metal vapour contours (right) | $P = 400$ W, $D_0 = 150$ μ m, $t = 4e-5$ s.

- Metal vapour ejected at a relatively high velocity (> 100 m/s).
- Recirculation flow on the side of the plume, source of denudation.
- The contours of metal vapour fraction highlights a characteristic mushroom shape due to Rayleigh-Taylor instability.

Figure 4 Local Mach number (at the interface) against absorbed laser intensity | $D_0 = 150$ μ m, $\tau_{pulse} = 0.3$ ms.

→ Plume velocity validated with Knight's analytical model².

Figure 5 Comparison of melted zone given by experiment and numerical model | $P = 320$ W, $D_0 = 205$ μ m (top hat), $\tau_{pulse} = 3$ ms.

Figure 6 Comparison between simulated and experimental melt pool width (left) and depth (right) | $P = 320$ W, $D_0 = 205$ μ m (top hat), $\tau_{pulse} = 3$ ms.

- Validation of the melt pool shape predicted by the model.
- Agreement between the numerically predicted melt pool dimensions and the experimental results.

CONCLUSIONS: Numerical simulation coupled with experimental study is a key toward understanding the complex physical phenomena which characterise LBM. COMSOL Multiphysics® provides simulation tools which have proven to be efficient to compute and analyse physical features related to metal vaporisation under laser irradiation. This first analysis is promising, the next step is to transpose the present model to powder bed conditions, first in 2D axisymmetric and then in real 3D configuration.

Experimental and Analytical Modeling of Natural Circulation and Forced Circulation BWRs Masahiro Furuya, 2006 20% of the Nuclear Power Plants are known as Boiling Water Reactors BWRs These BWRs have pumps that cool their reactor In the design of new BWRs ways to cool the core by a natural circulation flow without pumps also called natural circulation BWRs are being considered In these new systems a chimney is installed on top of the core to increase natural circulation flow A possible disadvantage of natural circulation BWRs might be their susceptibility to instabilities which could then lead to both flow and power oscillations The stability features of both natural circulation and forced circulation BWRs have been investigated thoroughly using dedicated experimental setups analytical models and numerical codes We distinguish between pure thermal hydraulic stability where the fission power is assumed to be constant and coupled thermalhydraulic neutronic stability where the two phase mixture in the core influences the fission chain reaction

Applied Mechanics Reviews, 1966 **Nuclear Thermal Hydraulic and Two-Phase Flow** Jun Wang, Kaiyi Shi, Zhaoming Meng, Shripad T. Revankar, 2018-10-11. Nuclear energy is one of the most important clean energy and contributes more than 10% electric power to human society in the past decades of years. The nuclear thermal hydraulic and two phase flow is one of the basic branches of nuclear technology and provides structure design and safety analysis to the nuclear power reactors. In the new century the basic theoretical research of thermal hydraulic and two phase flow and innovative design for the next generation nuclear power plants especially for the small modular reactor and molten salt reactor along with other nuclear branches constantly support the development of nuclear technology.

Scientific and Technical Aerospace Reports, 1975 **Third International Symposium on Two Phase Flow Modelling and Experimentation**, 2004 **Modeling Multiphase Materials Processes** Manabu Iguchi, Olusegun J. Ilegbusi, 2010-11-10. Modeling Multiphase Materials Processes Gas Liquid Systems describes the methodology and application of physical and mathematical modeling to multi phase flow phenomena in materials processing. The book focuses on systems involving gas liquid interaction the most prevalent in current metallurgical processes. The performance characteristics of these processes are largely dependent on transport phenomena. This volume covers the inherent characteristics that complicate the modeling of transport phenomena in such systems including complex multiphase structure, intense turbulence, opacity of fluid, high temperature coupled heat and mass transfer, chemical reactions in some cases and poor wettability of the reactor walls. Also discussed are solutions based on experimental and numerical modeling of bubbling jet systems, recent advances in the modeling of nanoscale multi phase phenomena and multiphase flows in micro scale and nano scale channels and reactors. Modeling Multiphase Materials Processes Gas Liquid Systems will prove a valuable reference for researchers and engineers working in mathematical modeling and materials processing.
