Bayesian Econometric Modelling for Big Data Hang

Qian, 2025-06-20 This book delves into scalable Bayesian statistical methods designed to tackle the challenges posed by big data. It explores a variety of divide and conquer and subsampling techniques seamlessly integrating these scalable methods into a broad spectrum of econometric models. In addition to its focus on big data, the book introduces novel concepts within traditional statistics such as the summation subtraction and multiplication of conjugate distributions. These arithmetic operators conceptualize pseudo data in the conjugate prior sufficient statistics that determine the likelihood and the posterior as a balance between data and prior information, adding an intriguing dimension to Bayesian analysis. This book also offers a deep dive into Bayesian computation. Given the intricacies of floating point representation of real numbers, computer programs can sometimes yield unexpected or theoretically impossible results. Drawing from his experience as a senior statistical software developer, the author shares valuable strategies for designing numerically stable algorithms. The book is an essential resource for a diverse audience: graduate students seeking foundational knowledge in Bayesian econometric models, early career statisticians eager to explore cutting edge advancements in scalable Bayesian methods, data analysts struggling with out of memory challenges in large datasets, and statistical software users and developers striving to program with efficiency and numerical stability.

Full Seismic Waveform Modelling and Inversion Andreas Fichtner, 2010-11-16

Recent progress in numerical methods and computer science allows us today to simulate the propagation of seismic waves through realistically heterogeneous Earth models with unprecedented accuracy. Full waveform tomography is a tomographic technique that takes advantage of numerical solutions of the elastic wave equation. The accuracy of the numerical solutions and the exploitation of complete waveform information result in tomographic images that are both more realistic and better resolved. This book develops and describes state of the art methodologies covering all aspects of full waveform tomography, including methods for the numerical solution of the elastic wave equation, the adjoint method, the design of objective functionals, and optimisation schemes. It provides a variety of case studies on all scales from local to global based on a large number of examples involving real data. It is a comprehensive reference on full waveform tomography for advanced students, researchers, and professionals.

Applied Statistical Modelling for Ecologists Marc Kéry, Kenneth F. Kellner, 2024-07-18

2025 PROSE Award Finalist in Environmental Science. Applied Statistical Modelling for Ecologists provides a gentle introduction to the essential models of applied statistics: linear models, generalized linear models, mixed, and hierarchical models. All models are fit with both a likelihood and a Bayesian approach using several powerful software packages widely used in research publications: JAGS, NIMBLE, Stan, and TMB. In addition, the foundational method of maximum likelihood is explained in a manner that ecologists can really understand. This book is the successor of the widely used Introduction to WinBUGS for Ecologists. Kéry Academic Press, 2010. Like its parent, it is extremely effective for both classroom use and self

Shepherd, 2012-12-06 About This Book This book is about training methods in particular fast second order training methods for multi layer perceptrons MLPs MLPs also known as feed forward neural networks are the most widely used class of neural network Over the past decade MLPs have achieved increasing popularity among scientists engineers and other professionals as tools for tackling a wide variety of information processing tasks In common with all neural networks MLPs are trained rather than programmed to carry out the chosen information processing function Unfortunately the traditional method for training MLPs the well known backpropagation method is notoriously slow and unreliable when applied to many practical tasks The development of fast and reliable training algorithms for MLPs is one of the most important areas of research within the entire field of neural computing The main purpose of this book is to bring to a wider audience a range of alternative methods for training MLPs methods which have proved orders of magnitude faster than backpropagation when applied to many training tasks The book also addresses the well known local minima problem and explains ways in which fast training methods can be combined with strategies for avoiding or escaping from local minima All the methods described in this book have a strong theoretical foundation drawing on such diverse mathematical fields as classical optimisation theory homotopic theory and stochastic approximation theory
