Modern Ocean Floor Processes and the Geological Record Rachel A. Mills, Keith Harrison, 1998 *Biogeochemistry of Marine Systems* Kenneth D. Black, Graham B. Shimmield, 2020-02-03 Marine systems vary in their sensitivities to perturbation Perturbation may be insidious such as increasing eutrophication of coastal areas or it may be dramatic such as a response to an oil spill or some other accident Climate change may occur incrementally or it may be abrupt and ecosystem resilience is likely to be a complex function of the interactions of the factors and species mediating key biogeochemical processes Biogeochemistry of Marine Systems considers issues of marine system resilience focusing on a range of marine systems that exemplify major global province types Each system is interesting in its own right on account of its sensitivity to natural or anthropogenic change or its importance as an ecological service provider Each contributing author concentrates on advances of the last decade This prime reference source for marine biogeochemists marine ecologists and global systems scientists provides a strong foundation for the study of the multiple marine systems undergoing change because of natural biochemical or anthropogenic factors

Non-volcanic Rifting of Continental Margins Geological Society of London, 2001 Non continental margins lack thick lavas that are generated as continental crust thins immediately prior to the onset of seafloor spreading They may form up to 30 per cent of passive margins around the world This volume contains papers examining an active margin fossil margins that border present day oceans and remnants of margins exposed today in the Alps The papers present evidence across a range of scales from individual mineral grains through borehole cores and outcrop to whole margins at the crustal scale

Epidotes Axel Liebscher, Gerhard Franz, 2018-12-17 Volume 56 of the Reviews in Mineralogy and Geochemistry reviews the current state of knowledge on the epidote minerals with special emphasis on the advances that were made since the comprehensive review of Deer et al 1986 In the Introduction we review the structure optical data and crystal chemistry of this mineral group all of which form the basis for understanding much of the following material in the volume In addition we provide some information on special topics such as morphology and growth deformation behavior and gemology Thermodynamic properties Chapter 2 Gottschalk the spectroscopy of the epidote minerals Chapter 3 Liebscher and a review of the experimental studies Chapter 4 Poli and Schmidt constitute the first section of chapters These fields are closely related and all three chapters show the significant progress over the last years but that some of the critical questions such as the problem of miscibility and miscibility gaps are still not completely solved This section concludes with a review of fluid inclusion studies Chapter 5 Klemm a topic that turned out to be of large interest for petrogenetic interpretation and leads to the description of natural epidote occurrences in the second section of the book These following chapters review the geological environments of the epidote minerals from low temperature in geothermal fields Chapter 6 Bird and Spieler to common metamorphic rocks Chapter 7 Grapes and Hoskin and to high and ultrahigh pressure Chapter 8 Enami Liou and Mattinson and the magmatic regime

Basins Gerhard Einsele, 2013-06-29 The modern geological sciences are characterized by extraordinarily rapid progress as well as by the development and application of numerous new and refined methods most of them handling an enormous amount of data available from all the continents and oceans. Given this state of affairs it seems inevitable that many students and professionals tend to become experts in relatively narrow fields and thereby are in danger of losing a broad view of current knowledge. The abundance of new books and symposium volumes testifies to this trend toward specialization. However, many geologic processes are complex and result from the interaction of many seemingly unrelated individual factors. This signifies that we still need generalists who have the broad overview and are able to evaluate the great variety of factors and processes controlling a geologic system such as a sedimentary basin. In addition, this also means that cooperation with other disciplines in the natural sciences and engineering is increasingly important. Modern textbooks providing this broad overview of the earth sciences are rare.

The Deposition of Organic-carbon-rich Sediments Nicholas Bennett Harris, 2005 Depositional models for organic carbon rich sediments have been the subjects of both great interest and great controversy for many years. These sediments serve as the ultimate source of virtually all oil and gas. They also represent the interface between biological and geological processes and provide critical evidence for the state of the atmosphere and oceans. Yet despite their importance and decades of research the origin of these sediments remains the source of vigorous disagreement. The twelve papers in this volume represent the cutting edge of research in this topic. They explore the origin of organic carbon rich sediments through a variety of techniques including sedimentology, geochemistry, paleontology and computer modeling. All papers take multidisciplinary approaches to the topic and together they demonstrate the complex interconnected processes that trigger the deposition of organic carbon. This book will appeal to geoscientists in many disciplines including explorers for petroleum who need models for source rock deposition, organic and inorganic geochemists who study processes in water and sediment, sedimentologists who interpret ancient deposition environments and climatologists and oceanographers who reconstruct the behavior of the ancient atmosphere and oceans.

Submarine Canyons: Human Connections to the Deep Sea Awantha Dissanayake, Veerle Ann Ida Huvenne, Jaime Selina Davies, Kostas Kiriakoulakis, 2023-11-27 Submarine canyons are some of the most prominent features of the world's continental margins, creating heterogeneity in the terrain, influencing local and global hydrodynamics and often creating hotspots of biodiversity both on the seafloor and in the water column. Canyon morphology and location on the margin make them the main conduits between the shelf and the deep sea, focussing the transport of sediments, organic matter, nutrients and increasingly pollutants and litter. The focus of this Research Topic is highlighting human connections to the deep sea.

Previous studies have underlined the need for a better understanding of anthropogenic impacts on submarine canyons and how they fast track our human footprint to the deep sea Besides a better assessment of the extent and nature of human activities in submarine canyons it primarily requires a holistic understanding of submarine canyons as systems governed by the interplay of geological sedimentological oceanographic and biological processes The goal of this Research Topic based on the recent INCISE2021 International Symposium on Submarine Canyons aims to fill that gap by gathering the latest observations of human activities in submarine canyons the latest insights in submarine canyon functioning and the latest interpretations on how the two are influencing each other

Tectonic Evolution, Collision, and Seismicity of Southwest Asia Rasoul Sorkhabi, 2017-12-21 Southwest Asia is one of the most remarkable regions on Earth in terms of active faulting and folding large magnitude earthquakes volcanic landscapes petroliferous foreland basins historical civilizations as well as geologic outcrops that display the protracted and complex 540 m y stratigraphic record of Earth s Phanerozoic Era Emerged from the birth and demise of the Paleo Tethys and Neo Tethys

oceans southwest Asia is currently the locus of ongoing tectonic collision between the Eurasia Arabia continental plates The region is characterized by the high plateaus of Iran and Anatolia fringed by the lofty ranges of Zagros Alborz Caucasus Taurus and Pontic mountains the region also includes the strategic marine domains of the Persian Gulf Gulf of Oman Caspian and Mediterranean This 19 chapter volume published in honor of Manuel Berberian a preeminent geologist from the region brings together a wealth of new data analyses and frontier research on the geologic evolution collisional tectonics active deformation and historical and modern seismicity of key areas in southwest Asia **Ofioliti** ,2006 **Marine Palaeoenvironmental Analysis from Fossils** Dan W. J. Bosence, Peter A. Allison, 1995 This volume critically reviews the use of fossils for the analysis of palaeoenvironments The papers are multi disciplinary drawing on a host of geochemical palaeoecological and palaeontological methods from traditional taxonomic uniformitarianism to more recently developed geochemical isotopic analyses The approach of the book is analytical rather than taxonomic concentrating on a range of techniques The common thread however is that it is palaeontological material that is being considered whether it be identifiable body fossils trace fossils distinctive fossil associates diagenetically unaltered material or organic compounds Using a number of methods and comparing their results allows different environmental controls to be isolated and provides more information on the record of past environmental parameters The volume focuses on the data obtained from organisms and their remains and will be of importance to sedimentologists stratigraphers and palaeontologists who need to maximize their palaeoenvironmental interpretations of depositional environments facies models sequence stratigraphy and palaeoclimates Provided by publisher
