**Process-Induced Chemical Changes in Food** Fereidoon Shahidi, Chi-Tang Ho, Nguyen Van Chuyen, 2013-11-11  
Chemical changes that occur in foods during processing and storage are manifold and might be both desirable and undesirable in nature. While many of the processes are carried out intentionally, there are also certain unwanted changes that naturally occur in food and might have to be controlled. Therefore, efforts are made to devise processing technologies in which desirable attributes of foods are retained and their deleterious effects are minimized. While proteins, lipids, and carbohydrates are the main nutrients of food that are affected by processing, it is their interaction with one another as well as involvement of low molecular weight constituents that affects their flavor, color, and overall acceptability. Thus, generation of aroma via thermal processing and bioconversion is of utmost importance in food preparation. Furthermore, processing operations must be optimized in order to eliminate or reduce the content of antinutrients that are present in foods and retain their bioactive components. Therefore, while novel processing technologies such as freezing, irradiation, microwaving, high pressure treatment, and fermentation might be employed, control process conditions in a manner that both the desirable sensory attributes and wholesomeness of foods are safeguarded is essential. Obviously, methodologies should also be established to quantitate the changes that occur in foods as a result of processing. This volume was developed from contributions provided by a group of internationally recognized lead scientists. *The Cumulative Book Index*, 1999

*American Book Publishing Record Cumulative 1998* R R Bowker Publishing, 1999-03 *Chemical Changes in Food during Processing* Thomas Richardson, John W. Finley, 1986-03-31 This volume results from the Eighth Basic Symposium held by the Institute of Food Technologists in Anaheim, California, on June 8-9, 1984. The theme of the symposium was Chemical Changes in Food during Processing. The speakers included a mix of individuals from academic institutions, governmental agencies, and the food industry. Twenty speakers discussed topics ranging from the basic chemistry relating to food constituents to the more applied aspects of chemical changes in food components during food processing. It was the intent of the organizers to bring together a group of speakers who could address the chemistry of changes in food components during processing from a mechanistic point of view. As a consequence, the proceedings of this symposium emphasize the basic chemistry of changes in food constituents from a generic perspective, which is intended to provide the reader with a background to address more specific problems that may arise. *Chemical Changes in Food During Processing* Richardson T., 1997 *Chemical Changes During Processing and Storage of Foods* Delia B. Rodriguez-Amaya, Jaime Amaya-Farfan, 2020-11-25 *Chemical Changes During Processing and Storage of Foods: Implications for Food Quality and Human Health* presents a comprehensive and updated discussion of the major chemical changes occurring in foods during processing and storage, the mechanisms and influencing factors involved, and their effects on food quality, shelf life, food safety,

and health Food components undergo chemical reactions and interactions that produce both positive and negative consequences This book brings together classical and recent knowledge to deliver a deeper understanding of this topic so that desirable alterations can be enhanced and undesirable changes avoided or reduced Chemical Changes During Processing and Storage of Foods provides researchers in the fields of food science nutrition public health medical sciences food security biochemistry pharmacy chemistry chemical engineering and agronomy with a strong knowledge to support their endeavors to improve the food we consume It will also benefit undergraduate and graduate students working on a variety of disciplines in food chemistry Offers a comprehensive overview of the major chemical changes that occur in foods at the molecular level and discusses the positive and negative effects on food quality and human health Describes the mechanisms of these chemical changes and the factors that impede or accelerate their occurrence Helps to solve daily industry problems such as loss of color and nutritional quality alteration of texture flavor deterioration or development of off flavor loss of nutrients and bioactive compounds or lowering of their bioefficacy and possible formation of toxic compounds
