

INTER-PROCESS PROFITS

Introduction:

While transferring the outputs of one process to another, the company might add some amount of profits to it. This is to get the actual cost of finished product as, if the company would have bought the inputs for the next process, it would be inclusive of profits. But, at the end of an accounting period, this inter process profit has to be excluded in order to get the real valuation of closing stock.

Inter process profit is a main aspect in Process costing.

Process costing:

Process costing is that form of operation costing which is used to ascertain the cost of the product at each process or stage of manufacture.

Application of process costing :

The industries in which process costs may be used are many. In fact a process costing system can usually be devised in all industries except where job, batch or unit operation costing is necessary.

Examples of industries, where process costing is applied are:-

1. Chemical works – Textile, weaving, spinning, etc.
2. Paper mills – Paint, Ink and varnishing, etc.

Advantages of process costing :

The following are the main advantages of process costing:

- It is possible to determine process costs periodically at short intervals. Unit cost can be computed weekly or even daily if overhead rates are used on predetermined basis.
- It is simple and less expensive to find out the process cost.
- It is possible to have managerial control by evaluating the performance of each process.
- It is easy to allocate the expenses to processes in order to have accurate cost.
