Technological Innovation as a Process

Having bounded our inquiry to that of understanding the evolution of knowledge-based technologies, we will now open up the lid of that black box. In this chapter, we will describe two of the most important analytic problems that make technological innovation so fascinating as well as so difficult to understand. They are:

1. how to portray technological innovation as a process of many discrete decisions and behaviors that unfold slowly over time
2. how to parse out the involvement of social units at many different levels of aggregation (including individuals, groups, organizations, industries, and economies) in technological innovation.

The Life Cycle of Technological Innovation

Technological innovation is neither a single event nor even a small number of discrete events. Technological innovation involves a rich embroidery of events; many activities, many decisions, and many bits of behavior on the part of individuals and social units, most of whom are not even self-consciously aware of being part of such a process.

One way of appreciating the vast number of discrete events that are encompassed in the process of technological innovation is to realize how long that process takes to unfold. From initial idea generation (which may or may not derive directly from scientific research) to widespread use of a technological innovation by an appropriate population of users, the time can range from months to decades. The environmental pressure exerted by a user community may accelerate the overall process. The first AIDS drugs appeared within a matter of months after public consciousness about the severity of the disorder, while in contrast, the first commercial photocopying products by Xerox
