The Dynkin Festschrift Mark I. Freidlin,2012-12-06 Onishchik A A Kirillov and E B Vinberg who obtained their first results on Lie groups in Dynkin's seminar At a later stage the work of the seminar was greatly enriched by the active participation of I I Pyatetskii Shapiro As already noted Dynkin started to work in probability as far back as his undergraduate studies In fact his first published paper deals with a problem arising in Markov chain theory The most significant among his earliest probabilistic results concern sufficient statistics In 15 and 17 Dynkin described all families of one dimensional probability distributions admitting non trivial sufficient statistics These papers have considerably influenced the subsequent research in this field But Dynkin's most famous results in probability concern the theory of Markov processes Following Kolmogorov Feller Doob and Ito Dynkin opened a new chapter in the theory of Markov processes He created the fundamental concept of a Markov process as a family of measures corresponding to various initial times and states and he defined time homogeneous processes in terms of the shift operators  $t$  In a joint paper with his student A *Stochastic Analysis and Applications* A.B. Cruzeiro,J.C. Zambrini,2012-12-06 At the end of the summer 1989 an international conference on stochastic analysis and related topics was held for the first time in Lisbon Portugal This meeting was made possible with the help of INIC and JNICT two organizations devoted to the encouragement of scientific research in Portugal The meeting was interdisciplinary since mathematicians and mathematical physicists from around the world were invited to present their recent works involving probability theory analysis geometry and physics a wide area of cross fertilization in recent years Portuguese scientific research is expanding fast these days faster some times than the relevant academic structures The years to come will be determinant for the orientation of those young Portuguese willing to take an active part in the international scientific community Lisbon's summer 89 meeting should initiate a new Iberic tradition attractive both for these researchers to be and of course for the selected guests Judging by the quality of contributions collected here it is not

unrealistic to believe that a tradition of southern randomness may well be established

Stochastic Analysis and Related Topics VII Laurent Decreusefond, Bernt Oksendal, Ali S. Üstünel, 2012-12-06 One of the most challenging subjects of stochastic analysis in relation to physics is the analysis of heat kernels on infinite dimensional manifolds The simplest nontrivial case is that of the path and loop space on a Lie group In this volume an up to date survey of the topic is given by Leonard Gross a prominent developer of the theory Another concise but complete survey of Hausdorff measures on Wiener space and its applications to Malliavin Calculus is given by D Feyel one of the most active specialists in this area Other survey articles deal with short time asymptotics of diffusion processes with values in infinite dimensional manifolds and large deviations of diffusions with discontinuous drifts A thorough survey is given of stochastic integration with respect to the fractional Brownian motion as well as Stokes formula for the Brownian sheet and a new version of the log Sobolev inequality on the Wiener space Professional mathematicians looking for an overview of the state of the art in the above subjects will find this book helpful In addition graduate students as well as researchers whose domain requires stochastic analysis will find the original results of interest for their own research The organizers acknowledge gratefully the financial help of the University of Oslo and the invaluable aid of Professor Bernt Oksendal and l Ecole Nationale Supérieure des Telecommunications

**Stable Processes and Related Topics** Cambanis, 2012-12-06 The Workshop on Stable Processes and Related Topics took place at Cornell University in January 9 13 1990 under the sponsorship of the Mathematical Sciences Institute It attracted an international roster of probabilists from Brazil Japan Korea Poland Germany Holland and France as well as the U

This volume contains a sample of the papers presented at the Workshop. All the papers have been refereed. Gaussian processes have been studied extensively over the last fifty years and form the bedrock of stochastic modeling. Their importance stems from the Central Limit Theorem. They share a number of special properties which facilitates their analysis and makes them particularly suitable to statistical inference. The many properties they share however is also the seed of their limitations. What happens in the real world away from the ideal Gaussian model. The non Gaussian world may contain random processes that are close to the Gaussian. What are appropriate classes of nearly Gaussian models and how typical or robust is the Gaussian model amongst them. Moving further away from normality what are appropriate non Gaussian models that are sufficiently different to encompass distinct behavior yet sufficiently simple to be amenable to efficient statistical inference. The very Central Limit Theorem which provides the fundamental justification for approximate normality points to stable and other infinitely divisible models. Some of these may be close to and others very different from Gaussian models.

**Stochastic Analysis and Related Topics** H. Körezlioglu, A.S. Üstünel, 2012-12-06 This volume contains a large spectrum of work: super processes, Dirichlet forms, anticipative stochastic calculus, random fields and Wiener space analysis. The first part of the volume consists of two main lectures given at the third Silivri meeting in 1990: 1. Infinitely divisible random measures and superprocesses by D.A. Dawson; 2. Dirichlet forms on infinite dimensional spaces and applications by M. Rockner. The second part consists of recent research papers all related to Stochastic Analysis motivated by stochastic partial differential equations, Markov fields, the Malliavin calculus and the Feynman path integrals. We would herewith like to thank the ENST for its material support for the above mentioned meeting as well as for the initial preparation of this volume and to our friend and colleague Erhan Qmlar whose help and encouragement for the realization of this volume have been essential.

**Probability in Banach Spaces 6** Haagerup, 2012-12-06 This volume contains a selection of papers by the participants of the 6th International Conference on Probability in Banach Spaces, Sandbjerg, Denmark, June 16-21, 1986. The conference was attended by 45 participants from several countries. One thing makes this conference completely different from the previous five ones, namely that it was arranged jointly in Probability in Banach spaces and Banach space theory with almost equal representation of scientists in the two fields. Though these fields are closely related it seems that direct collaboration between researchers in the two groups has been seldom. It is our feeling that the conference where the participants were together for five days taking part in lectures and intense discussions of mutual problems has contributed to a better understanding and closer collaboration in the two fields. The papers in the present volume do not cover all the material presented in the lectures; several results covered have been published elsewhere. The sponsors of the conference are The Carlsberg Foundation, The Danish Natural Science Research Council, The Danish Department of Education, The Department of Mathematics, Odense University, The Department of Mathematics, Aarhus University, The Knudsen Foundation.

Odense Odense University The Research Foundation of Aarhus University The Thborg Foundation The participants and the organizers would like to thank these institutions for their support The Organizers Contents A de Acosta and M Ledoux On the identification of the limits in the law of the iterated logarithm in Banach spaces **High Dimensional Probability II** Evarist Giné, David M. Mason, Jon A. Wellner, 2012-12-06 High dimensional probability in the sense that encompasses the topics represented in this volume began about thirty years ago with research in two related areas limit theorems for sums of independent Banach space valued random vectors and general Gaussian processes An important feature in these past research studies has been the fact that they highlighted the essential probabilistic nature of the problems considered In part this was because by working on a general Banach space one had to discard the extra and often extraneous structure imposed by random variables taking values in a Euclidean space or by processes being indexed by sets in  $\mathbb{R}$  or  $\mathbb{R}^d$  Doing this led to striking advances particularly in Gaussian process theory It also led to the creation or introduction of powerful new tools such as randomization decoupling moment and exponential inequalities chaining isoperimetry and concentration of measure which apply to areas well beyond those for which they were created The general theory of empirical processes with its vast applications in statistics the study of local times of Markov processes certain problems in harmonic analysis and the general theory of stochastic processes are just several of the broad areas in which Gaussian process techniques and techniques from probability in Banach spaces have made a substantial impact Parallel to this work on probability in Banach spaces classical probability and empirical process theory were enriched by the development of powerful results in strong approximations

*Probability in Banach Spaces 7* Eberlein, Külbs, Marcus, 2012-12-06 The first international conference on Probability in Banach Spaces was held at Oberwolfach West Germany in 1975 It brought together European researchers who under the inspiration of the Schwartz Seminar in Paris were using probabilistic methods in the study of the geometry of Banach spaces a rather small number of probabilists who were already studying classical limit laws on Banach spaces and a larger number of probabilists specialists in various aspects of the study of Gaussian processes whose results and techniques were of interest to the members of the first two groups This first conference was very fruitful It fostered a continuing relationship among 50 to 75 probabilists and analysts working on probability on infinite dimensional spaces the geometry of Banach spaces and the use of random methods in harmonic analysis Six more international conferences were held since the 1975 meeting Two of the meetings were held at Tufts University one at Sønderborg Denmark and the others at Oberwolfach This volume contains a selection of papers by the participants of the Seventh International Conference held at Oberwolfach West Germany June 26 July 2 1988 This exciting and provocative conference was attended by more than 50 mathematicians from many countries These papers demonstrate the range of interests of the conference participants In addition to the ongoing study of classical and modern limit theorems in Banach spaces a branching out has occurred among the members of this group **From Brownian Motion to Schrödinger's Equation** Kai L. Chung, Zhongxin Zhao, 2012-12-06 In recent years the study of the

theory of Brownian motion has become a powerful tool in the solution of problems in mathematical physics This self contained and readable exposition by leading authors provides a rigorous account of the subject emphasizing the explicit rather than the concise where necessary and addressed to readers interested in probability theory as applied to analysis and mathematical physics A distinctive feature of the methods used is the ubiquitous appearance of stopping time The book contains much original research by the authors some of which published here for the first time as well as detailed and improved versions of relevant important results by other authors not easily accessible in existing literature     Selected Works Of Kai Lai Chung Elton P Hsu, Farid Aitsahlia, Ruth Williams, 2008-10-22 This unique volume presents a collection of the extensive journal publications written by Kai Lai Chung over a span of 70 odd years It was produced to celebrate his 90th birthday The selection is only a subset of the many contributions that he made throughout his prolific career Another volume Chance and Choice published by World Scientific in 2004 contains yet another subset with four articles in common with this volume Kai Lai Chung s research contributions have had a major influence on several areas in probability Among his most significant works are those related to sums of independent random variables Markov chains time reversal of Markov processes probabilistic potential theory Brownian excursions and gauge theorems for the Schrödinger equation As Kai Lai Chung s contributions spawned critical new developments this volume also contains retrospective and perspective views provided by collaborators and other authors who themselves advanced the areas of probability and mathematics
