Human and Animal Filariases Ronald Kaminsky, Timothy G.

Geary, 2022-10-24 Human and Animal Filariases The rational approach to controlling human and animal diseases caused by nematodes Filariae are a family of parasitic worms which infect animals and humans causing severe diseases such as elephantiasis lymphatic filariasis and river blindness onchocerciasis in humans as well as heartworm disease dirofilariasis in dogs and cats While the human diseases are rarely fatal the blindness and disfiguration resulting from these infections constitute a severe burden for the affected individuals and to the healthcare systems in many tropical countries In 2017 the World Health Organization classified several filariases as neglected tropical diseases and announced a new program seeking to eradicate these infections which has in turn sparked a new push to develop antifilarial drugs Considering the current and future import of this topic Human and Animal Filariases takes a comprehensive look at infections by filarial parasites in humans and in animals It begins by reviewing the current state of diagnosis and chemotherapy before addressing the increasing resistance to available antifilarial drugs This is followed by strategies and approaches for the discovery of novel drugs and finally by looking at alternative and supplementary approaches to combat the parasites including vector control and vaccination Human and Animal Filariases readers will find A comprehensive approach that integrates current chemotherapy with recent advances in antifilarial drug discovery Practical information on assay development target validation and required drug product profiles Insights from global experts from leading academic institutions as well as from pharma and healthcare companies Human and Animal Filariases is a unique reference for parasitologists veterinarians as well as professionals in the pharmaceutical industry and in public health agencies

Neuropeptide Systems as Targets for Parasite and Pest Control Timothy G. Geary, Aaron Maule, 2011-01-13 The need to continually discover new agents for the control or treatment of invertebrate pests and pathogens is undeniable Agriculture both animal and plant succeeds only

to the extent that arthropod and helminth consumers vectors and pathogens can be kept at bay Humans and their companion animals are also plagued by invertebrate parasites The deployment of chemical agents for these purposes inevitably elicits the selection of resistant populations of the targets of control necessitating a regular introduction of new kinds of molecules Experience in other areas of chemotherapy has shown that a thorough understanding of the biology of disease is an essential platform upon which to build a discovery program Unfortunately investment of research resources into understanding the basic physiology of invertebrates as a strategy to illuminate new molecular targets for pesticide and parasiticide discovery has been scarce and the pace of introduction of new molecules for these indications has been slowed as a result An exciting and so far unexploited area to explore in this regard is invertebrate neuropeptide physiology This book was assembled to focus attention on this promising field by compiling a comprehensive review of recent research on neuropeptides in arthropods and helminths with contributions from many of the leading laboratories working on these systems
