Patterns, Defects and Microstructures in Nonequilibrium Systems	D. Walgraef, 2012-12-06			

One of the most fascinating and intriguing aspects of natural phenomena is that complex systems may undergo symmetry breaking instabilities leading to pattern formation or coherent temporal behavior over macroscopic space and time scales. Therefore the understanding of why order may appear spontaneously in open systems far from equilibrium and which patterns are selected among a large manifold of possibilities has become a major theme of research both theoretically and experimentally. These studies first related to fundamental questions appear now to be of technological importance especially for materials.

science problems Effectively during the last years the whole field of materials science experienced a complete renewal By using techniques able to operate in strong nonequilibrium conditions and hence to escape from the constraints of equilibrium thermodynamics totally new materials structures have been processed Such techniques include ion implantation laser beam surface melting as well as electron beam heating For example ion implantation processing is able to create surfaces with compositions markedly different from the bulk leading to materials having new electric magnetic or chemical properties In laser annealing after the tremendously rapid melting and recrystallization of the sample surfaces microstructures with superior resistance to friction corrosion are frozen into place Rapid solidification of alloys trigger the formation of quasi crystalline structures Ion beam mixing can modify the electrical properties of polymers or improve the adhesion of metallic films to ceramics
