genetic characteristics The study of cancer will be profoundly impacted by the Human Genome Project I would like to discuss some of these changes The first draft of the human genome sequence was announced in June 2000 and we have just scratched the surface of the changes it will engender in medicine A relevant question is what are the long term effects of the Human Genome Project for medicine I would argue that there are three and each of these three point toward the view that systems biology will dominate biology and medicine of the 21st century First the Human Genome Project introduced a new type of science discovery science Discovery science takes a biological system e g the genome and defines all of its elements e g the sequences of the 24 human chromosomes Thus it creates a rich infrastructure from which the classical hypothesis driven science can be done more effectively The effective integration of discovery and hypothesis driven science is a key for systems approaches to biology and medicine Second the Human Genome Project has provided a periodic table of life
