Les matériaux utilisés pour réaliser des composants optiques sont  
 ± **absorbants** (pertes énergétiques selon le trajet Flux ↓ si L ↑)  
 ± **réfringents** (déviation du faisceau au franchissement d'un dioptre,...)  
 ± **réfléchissants** (pertes au franchissement d'un dioptre, images multiples,...)  
 ± **dispersifs** (trajet différents selon la couleur  $\lambda$ , ...)

## 1 - Absorption de lumière par le milieu de propagation

### Filtres atténuateurs neutre

- α Composant utilisé pour faire diminuer le flux F ↓
- ∞ Atténuation  $A = \frac{F_{out}}{F_{in}}$   
ex : si  $A = 0,1$  seul 10% du flux passe le filtre
- ∞ A facteur de perte par absorption  $0 \leq A \leq 1$   
matériau : opaque  $A = 0$ , transparent  $A \approx 1$
- ∞ Selon le modèle : A fixé ou réglable (orientation)

**Absorption : loi de Beer**  $F(L) = F_0 \exp(-\alpha(\lambda)L)$

Le flux de lumière traversant un cylindre de section constante décroît exponentiellement lorsque sa longueur L augmente avec  $\alpha(\lambda)$  coefficient d'absorption (en  $m^{-1}$ ) caractéristique du milieu de propagation.

**Atténuation A selon l'épaisseur (sans unité)**  $A = \frac{F(L)}{F_0} = \exp(-\alpha(\lambda)L)$

**Atténuation  $A_{dB}$  (en dB)**  $A_{dB} = -10 \log_{10}(A) = -10 \log_{10}\left(\frac{F(L)}{F_0}\right)$

Une échelle logarithmique facilite l'usage des nombres très petits

*Propriétés acoustiques des matériaux* Parviz Navi, 2006-01-01 Cet ouvrage présente tout d'abord les principaux éléments de l'acoustique physique et les bases analytiques nécessaires à la description du phénomène de propagation des ondes planes harmoniques. Sont traités les cas des fluides et des solides qu'ils soient homogènes ou hétérogènes purement élastiques ou viscoélastiques. À partir des modèles développés des méthodes de caractérisation non destructive des propriétés effectives des milieux présentés sont tabulés. Ces modèles appliqués la formule générale du transfert constituent un puissant outil permettant de traiter la quasi-totalité des problèmes d'absorption et d'isolation rencontrés dans les matériaux de construction. En marge des préoccupations liées à notre environnement sonore, cette problématique concerne également les phénomènes vibratoires liés aux manifestations sismiques, les techniques émergentes de microscopie acoustique ou encore de contrôle de qualité in situ. ### **Phenomena Induced by Intermolecular**

**Interactions** G. Birnbaum, 2013-03-09 This book is concerned with recent experimental and theoretical work dealing with phenomena created by the transient dipoles and polarizabilities produced by intermolecular interactions. The former produce absorption from the microwave to the optical regions of the spectrum and the latter produce Rayleigh and Raman scattering. Such absorption and scattering would be absent without collisions. Static properties such as dielectric constant, refractive index and Kerr effect also exhibit the effects of induced dipoles and polarizabilities. The first observation of an infrared absorption spectrum produced by the collisions of molecules which ordinarily do not have an allowed dipole transition was reported in 1949 Crawford, Welsh and Locke. The first observation of depolarized Rayleigh spectra due to collisions in atomic gases appeared in 1968 McTague and Birnbaum. However, it was not until 1977 that the first conference dealing with collision-induced phenomena was organized by J. D. Poll at the University of Guelph. This conference was mainly concerned with studies of collision-induced absorption in gases. Light scattering received more attention at the second meeting of the collision-induced community in 1978 at the E. Fermi Summer School on Intermolecular Spectroscopy and Dynamical Properties of Dense Systems organized by J. Van Kranendonk. However, the emphasis was still on collision-induced absorption in compressed gases, although some work on liquids, solid H<sub>2</sub> and related subjects such as rotational relaxation was included. The third induced phenomena conference organized by F.

Jamin, Edmond Marie Léopold Bouty, 1881 **Collision- and Interaction-Induced Spectroscopy** G.C. Tabisz, Murray N. Neuman, 2012-12-06 Collision or interaction induced spectroscopy refers to radiative transitions which are forbidden in free atoms or molecules but which occur in clusters of interacting atoms or molecules The most common phenomena are induced absorption in the infrared region and induced light scattering which involves inelastic scattering of visible laser light The particle interactions giving rise to the necessary induced dipole moments and polarizabilities are modelled at long range by multipole expansions at short range electron overlap and exchange mechanisms come into play Information on atomic and molecular interactions and dynamics in dense media on a picosecond timescale may be drawn from the spectra Collision induced absorption in the infrared was discovered at the University of Toronto in 1949 by Crawford Welsh and Locke who studied liquid O and N Through the 1950s and 1960s the experimental elucidation of the phenomenon particularly in gases continued and theoretical underpinnings were established In the late 1960s the related phenomenon of collision induced light scattering was first observed in compressed inert gases In 1978 an Enrico Fermi Summer School was held at Varenna Italy under the directorship of J Van Kranendonk The lectures there reviewed activity from the previous two decades during which the approach to the subject had not changed greatly In 1983 a highly successful NATO Advanced Research Workshop was held at Bonas France under the directorship of G Birnbaum An important outcome of that meeting was the demonstration of the maturity and sophistication of current experimental and theoretical techniques
