Wasserman,Lori Wasserman,2020-10-27 Our understanding of how the human brain operates and completes its essential tasks continues is fundamentally altered from what it was ten years ago We have moved from an understanding based on the modularity of key structural components and their specialized functions to an almost diametrically opposed highly integrated neural network model based on a vertically organized brain dependent on small world hub principles This new understanding completely changes how we understand essential psychological constructs such as motivation Network modeling posits that motivation is a construct that describes a modified aspect of the operation of the human learning system that is specifically designed to cause a person to pursue a goal Anthropologically and developmentally these goals were initially basic including things like food shelter and reproduction Over the course of time and development they develop into a complex web of extrinsic and then intrinsic goals objectives and values The core for all of this development is the inborn flight or fight reaction has been modified over time by a combination of inborn human temperamental characteristics and life experiences This process of modification is in part based on the operation of a network based error prediction network working in concert with the reward network to produce a system of ever evolving valuations of goals and objectives These valuations are never truly fixed They are constantly evolving being modified and shaped by experience The error prediction network and learning related networks work in concert with the limbic system to allow affect laden experiences to inform the process of valuation These networks operating in concert produce a cognitive process we call motivation Like most networks the motivation system of networks is recruited when the task demands of the situation require them Understanding motivation from this perspective has profound implications for many scientific disciplines in general and psychology in specific Psychologically this new understanding will alter how we understand client behavior in therapy and when being evaluated This new understanding will provide direction for new therapeutic intervention for a variety of disorders of mental health It will also inform testing practices concerning the evaluation of effort and malingering This book is not a project in reductionism It is the polar opposite A neural network understanding of the operation of the human brain allows for the integration of what has come before into a comprehensive and integrated model It will likely provide the basis for future research for years to come

Effects of Game and Game-like Training on Neurocognitive Plasticity Guido P. H. Band, Chandramallika Basak, Heleen A. Slagter, Michelle W. Voss, 2016-05-17 Cognitive training is not always effective This is also the case for the form of cognitive training that this Research Topic focuses on prolonged performance on game like cognitive tasks The ultimate goal of this cognitive training is to improve ecologically valid target functions For example cognitive training should help children with ADHD to stay focused at school or help older adults to manage the complexity of daily life However so far this goal has proven too ambitious Transfer from trained to non trained tasks is not even guaranteed in a laboratory so there is a strong need for understanding how when and for how long cognitive training has effect Which cognitive functions are amenable to game training for whom and how Are there mediating factors for success such as motivation attention or age Are the improvements real or can they be attributed to nonspecific factors such as outcome expectancy or demand characteristics Are there better strategies to improve cognitive functions through game training This Research Topic of Frontiers in Human Neuroscience charts current insights in the determinants of success of game training

Neural processing of emotion in multimodal settings Martin Klasen, Benjamin Kreifelts, Yu-Han Chen, Janina Seubert, Klaus Mathiak, 2015-05-06 Our everyday life is characterized by a multitude of emotionally relevant cues that we perceive and communicate via various sensory channels This does not only encompass the obvious cases of auditory and visual modalities but also olfactory gustatory and even tactile stimuli Any kind of emotional situation in a natural setting is usually a

multimodal experience A friend welcomes us with warm words a smile and a happy voice the sight of our favourite food is accompanied by a seductive smell and a delicious taste the thrill of watching an exciting movie scene is intensified by a gripping soundtrack In these situations the signals from various senses do not stand on their own they interact and create a unified emotional experience Recent neuroscientific research has begun to accommodate this inherent multimodality of emotions in natural situations by studying the interaction of affectively relevant information from more than one sensory channel Fascinating new aspects emerge concerning the neurobiology of emotion processing and there is evidence that integrating emotional cues from various sources invokes brain processes that go beyond the well known patterns observed during unimodal stimulation The aim of this volume is to present novel and interesting studies dealing with the multimodality of emotions and their neural processing This includes findings from novel paradigms beyond the classical stimulus response pattern fascinating new insights into the interaction of the chemical senses new analysis methods comprehensive reviews of selected topics multimodality in social interactions and clinical perspectives Taken together the studies of this volume thus help us to better understand the interplay of various senses in our daily emotional experiences
