Congress Senate, 1962 Neuronal Recognition Samuel Barondes, 2013-11-11 An outstanding characteristic of the nervous system is that neurons make selective functional contacts Each neuron behaves as if it recognizes the neurons with which it associates and rejects associations with others The specific interneuronal relationships that result define the innate neuronal circuits that determine the functioning of this system The purpose of this volume is to present some approaches to the problem of neuronal recognition The volume has been somewhat arbitrarily divided into three sections In the first section the overriding theme is the degree of specificity of neuronal recognition How specific is specific Is the specificity so precise that the neurites of one neuron will only make synaptic contact with a unique target neuron If less precise within what range Are the rules for specification that are operative in the embryo still operative at the same level of precision when connections regenerate in the mature organism Are they still operative in dissociated tissue grown in culture The second section of this volume contains reviews of morphological studies of synaptogenesis and biochemical studies of synaptic components Can the morphology of developing cellular contacts provide clues about selectivity Can the chemical components of synaptic junctions be isolated and characterized Do they include resolvable components that mediate neuronal recognition The third section contains studies seeking to identify the existence of specific molecules that might mediate cellular recognition A major question here is whether molecules of this type even exist *Home Science Class 11 Bihar Board* Meera Goyal, 2024-09-29 1 Digestive System 2 Sensory Organs 3 Infection Immunity 4 Immunization Schedule for Mother and Child
