Numerical Linear Algebra for Applications in Statistics James E. Gentle, 2012-12-06 Numerical linear algebra is one of the most important subjects in the field of statistical computing Statistical methods in many areas of application require computations with vectors and matrices This book describes accurate and efficient computer algorithms for factoring matrices solving linear systems of equations and extracting eigenvalues and eigenvectors Although the book is not tied to any particular software system it describes and gives examples of the use of modern computer software for numerical linear algebra An understanding of numerical linear algebra requires basic knowledge both of linear algebra and of how numerical data are stored and manipulated in the computer The book begins with a discussion of the basics of numerical computations and then describes the relevant properties of matrix inverses matrix factorizations matrix and vector norms and other topics in linear algebra hence the book is essentially self contained The topics addressed in this book constitute the most important material for an introductory course in statistical computing and should be covered in every such course The book includes exercises and can be used as a text for a first course in statistical computing or as supplementary text for various courses that emphasize computations James Gentle is University Professor of Computational Statistics at George Mason University During a thirteen year hiatus from academic work before joining George Mason he was director of research and design at the world s largest independent producer of Fortran and C general purpose scientific software libraries These libraries implement many algorithms for numerical linear algebra He is a Fellow of the American Statistical Association and member of the International Statistical Institute He has

High Performance Algorithms and Software in Nonlinear Optimization Renato de Leone, Almerico Murli, Panos M. Pardalos, Gerardo Toraldo, 2013-12-01 This book contains a selection of papers presented at the conference on High Performance Software for Nonlinear Optimization HPSN097 which was held in Ischia Italy in June 1997 The rapid progress of computer technologies including new parallel architectures has stimulated a large amount of research devoted to building software environments and defining algorithms able to fully exploit this new computational power In some sense numerical analysis has to conform itself to the new tools The impact of parallel computing in nonlinear optimization which had a slow start at the beginning seems now to increase at a fast rate and it is reasonable to expect an even greater acceleration in the future As with the first HPSNO conference the goal of the HPSN097 conference was to supply a broad overview of the more recent developments and trends in nonlinear optimization emphasizing the algorithmic and high performance software aspects Bringing together new computational methodologies with theoretical advances and new computer technologies is an exciting challenge that involves all scientists willing to develop high performance numerical software This book contains several important contributions from different and complementary standpoints Obviously the articles in the book do not cover all the areas of the conference topic or all the most recent developments because of the large number of new theoretical and computational ideas of the last few years
