Organization Of Neural Networks:

Organization of Neural Networks Werner von Seelen, Gordon Lionel Shaw, Ulrich Michael Leinhos, 1988

Self-Organization, Computational Maps, and Motor Control P.G. Morasso, V. Sanguineti, 1997-03-19 In the study of the computational structure of biological robotic sensorimotor systems distributed models have gained center stage in recent years with a range of issues including self organization non linear dynamics field computing etc This multidisciplinary research area is addressed here by a multidisciplinary team of contributors who provide a balanced set of articulated presentations which include reviews computational models simulation studies psychophysical and neurophysiological experiments The book is divided into three parts each characterized by a slightly different focus in part I the major theme concerns computational maps which typically model cortical areas according to a view of the sensorimotor cortex as geometric engine and the site of internal models of external spaces Part II also addresses problems of self organization and field computing but in a simpler computational architecture which although lacking a specialized cortical machinery can still behave in a very adaptive and surprising way by exploiting the interaction with the real world Finally part III is focused on the motor control issues related to the physical properties of muscular actuators and the dynamic interactions with the world The reader will find different approaches on controversial issues such as the role and nature of force fields the need for internal representations the nature of invariant commands the vexing question about coordinate transformations the distinction between hierarchical and bi directional modelling and the influence of muscle stiffness

Neural Networks and Simulation Methods Wu, 1993-12-14 This work explains network dynamics learning paradigms and computational capabilities of feedforward self organization and feedback neural network models addressing specific problems such as data fusion and data modeling It goes on to describe a neural network simulation software package USTCNET and gives some segments of the program

Development and Organization of Neural Networks Leon N. Cooper, BROWN UNIV PROVIDENCE RI CENTER FOR NEURAL SCIENCE., United States. Army Research Office, Brown University, 1988 Previously the author had proposed a single cell theory for the development of selectivity and ocular dominance in a neural network During the contract period this theory has been generalized to incorporate more realistic neural networks that approximate the actual anatomy of small

regions of cortex In particular he has analyzed a network consisting of excitatory and inhibitory cells both which may receive information from LGN These two cortical cell types then interact through intracortical connections that are either excitatory or inhibitory This investigation of the evolution of a cell in this mean field network of fixed points that have been obtained previously in the single cell theory are successfully generalized here In addition the author has been able to make explicit further statements concerning the independent effects of excitatory and inhibitory neurons on selectivity and ocular dominance For example shutting off inhibitory cells lessens selectivity and alters ocular dominance masked synapses These inhibitory cells may be selective but there is no theoretical necessity that they be so

Neural Information Processing and VLSI Bing J. Sheu, Joongho Choi, 2012-12-06 *Neural Information Processing and VLSI* provides a unified treatment of this important subject for use in classrooms industry and research laboratories in order to develop advanced artificial and biologically inspired neural networks using compact analog and digital VLSI parallel processing techniques *Neural Information Processing and VLSI* systematically presents various neural network paradigms computing architectures and the associated electronic optical implementations using efficient VLSI design methodologies Conventional digital machines cannot perform computationally intensive tasks with satisfactory performance in such areas as intelligent perception including visual and auditory signal processing recognition understanding and logical reasoning where the human being and even a small living animal can do a superb job Recent research advances in artificial and biological neural networks have established an important foundation for high performance information processing with more efficient use of computing resources The secret lies in the design optimization at various levels of computing and communication of intelligent machines Each neural network system consists of massively paralleled and distributed signal processors with every processor performing very simple operations thus consuming little power Large computational capabilities of these systems in the range of some hundred giga to several tera operations per second are derived from collectively parallel processing and efficient data routing through well structured interconnection networks Deep submicron very large scale integration VLSI technologies can integrate tens of millions of transistors in a single silicon chip for complex signal processing and information manipulation The book is suitable for those interested in efficient neurocomputing as well as those curious about neural network system applications It has been especially prepared for use as a text for advanced undergraduate and first year graduate students and is an excellent reference book for researchers and scientists working in the fields covered
