

New Approach to Transforming Aromatic Compounds with Boron and Silicon

Organoboron and organosilicon compounds have extensive applications in medicine, chemical synthesis, and optoelectronics

However, selectively introducing both boron and silicon on aromatic nitrogen heterocycles is challenging

New method for dearomative triple elementalization (carbo-sila-boration) of quinolines

Quinolines

Transition-metal-free one-pot reaction

Excellent chemo-, regio-, and stereoselectivity

Only needs visible light as an additive

Dearomative triple elementalization

Excitation of Si-B with visible light

The new method enables simultaneous insertion of boron and silicon into more types of aromatic molecules, and could serve as synthetic platforms

Organometallic chemistry is an interdisciplinary science which continues to grow at a rapid pace Although there is continued interest in synthetic and structural studies the last decade has seen a growing interest in the potential of organometallic chemistry to provide answers to problems in catalysis synthetic organic chemistry and also in the development of new materials This Specialist Periodical Report aims to reflect these current interests reviewing progress in theoretical organometallic chemistry main group chemistry the lanthanides and all aspects of transition metal chemistry Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research Written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry For over 80 years the Royal Society of Chemistry and its predecessor the Chemical Society have been publishing reports charting developments in chemistry which originally took the form of Annual Reports However by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series Specialist Periodical Reports was born The Annual Reports themselves still existed but were divided into two and subsequently three volumes covering Inorganic Organic and Physical Chemistry For more general coverage of the highlights in chemistry they remain a must Since that time the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry Some titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued The current list of Specialist Periodical Reports can be seen on the inside flap of this volume **Boron Science** Narayan S. Chemical vapour deposition of boron-carbon thin films from organoboron precursors Maiwulidan (Mewlude) Yimamu (Imam), 2016-01-13 Boron carbon BxC thin films enriched in ^{10}B are potential neutron converting layers for ^{10}B based solid state neutron detectors given the good neutron absorption cross section of ^{10}B atoms in the thin film Chemical Vapour Deposition CVD of such films faces the challenge that the maximum temperature tolerated by the aluminium substrate is 660°C and low temperature CVD routes for BxC films are thus needed This thesis presents the use of two different organoboron precursors triethylboron $\text{B}(\text{C}_2\text{H}_5)_3$ TEB and trimethylboron $\text{B}(\text{CH}_3)_3$ TMB as single source precursors for CVD of BxC thin films The CVD behaviour of TEB in thermal CVD has been studied by both BxC thin film deposition and quantum chemical calculations of the gas phase chemistry at the corresponding CVD conditions The calculations predict that the gas phase reactions are dominated by hydride eliminations of C_2H_4 to yield BH_3 In addition a complementary bimolecular reaction path based on H_2 assisted C_2H_6 elimination to BH_3 is also present at lower temperatures in the presence of hydrogen molecules A temperature window of $600\text{--}1000^\circ\text{C}$ for deposition of X ray amorphous BxC films with 2.5×4.5 is identified showing good film density $2.40\text{--}2.65\text{ g cm}^{-3}$ which is close to the bulk density of crystalline B_4C 2.52 g cm^{-3} and high hardness $29\text{--}39\text{ GPa}$ The impurity level of H is lowered to 1 at % within the temperature window Plasma chemical vapour deposition has been studied using TMB as single source precursor in Ar plasma for investigating BxC thin film deposition at lower temperature than allowed by thermal CVD and further understanding of thin film deposition process The effect of plasma power total pressure TMB and Ar gas flow on film composition and morphology are investigated The highest B/C ratio of 1.9 is obtained at highest plasma power of 2400 W and TMB flow of 7 sccm The H content in the films seems constant at 15.5 at % The B/C bond is dominant in the films with small amount of C-C and B-O bonds which are likely due to the formation of amorphous carbon and surface oxidation respectively The film density is determined as $2.16\text{--}0.01\text{ g cm}^{-3}$ and the internal compressive stresses are measured to be
