Origin And Evolution Of Mammals:

The Origin and Evolution of Mammals T. S. Kemp, 2005 Mammals are the dominant large animals of today occurring in virtually every environment This book is an account of the remarkable 320 million year long fossil record that documents their origin their long spell as no more than small nocturnal creatures and their explosive radiation since the extinction of the dinosaurs 65 million years ago Tom Kemp also unveils the exciting molecular evidence which coupled with important new fossils is presently challenging current thinking on the interrelationships and historical biogeography of mammals The Origin and Evolution of Mammals will be of interest to advanced undergraduate and graduate students as well as researchers in vertebrate palaeontology biogeography mammalian systematics and molecular taxonomy It will also be welcomed by vertebrate fossil enthusiasts and evolutionary biologists of all levels with an interest in macroevolutionary problems The Origin and Evolution of Mammals Thomas Stainforth Kemp, 2005 The Synapsida are the mammal like reptiles and mammals a group that diverged from a common ancestor shared with reptiles and birds about 340 million years The fossil record of the synapsids is extraordinarily good and documents the three phases of the history of the group each one of which points to important evolutionary generalisations as well as relating an intrinsically fascinating story The first stage leads from the origin of the group to the earliest mammals The non mammalian synapsids constituted the first radiation of fully terrestrial vertebrates dominating the land long before the dinosaurs displaced them and took over that role The fossil record illustrates the relationship between this radiation and the environmental conditions of the Permo Triassic when it occurred It also illustrates to a far greater degree than any other fossil record the origin of a major new taxon The sequence of acquisition of mammalian structures and functions inferred from the fossils leads to an interpretation about the processes involved in the evolution of mammalian biological organisation The second stage is the Mesozoic history of mammals Throughout the Jurassic and Cretaceous Periods mammals remained small insectivorous or omnivorous animals living a nocturnal existence They were abundant and diverse but failed completely to evolve into any of the middle sized and large sized forms familiar amongst today's mammals This is usually though not completely satisfactorily explained by competitive exclusion by dinosaurs The third stage is the great Cenozoic radiation of mammals From the moment the dinosaurs disappeared 65 million years ago new kinds of mammals proceeded to evolve Medium and large bodied herbivore and carnivore groups appeared early and from then onwards a kaleidoscope of origins flourishings and extinctions of lineages of mammals took place This great story interweaves changing climates shifting continents ecological opportunities and the fulfilment of the adaptive potential of Mammalia The latest molecular evidence that is having a huge impact on ideas about the timing and origins of the modern mammalian taxa is discussed along with the fossil evidence The book reviews these three stages in turn bringing up to date the palaeontological evidence and incorporating the molecular taxonomic data that has been rapidly accumulating over the last few years and which is responsible for a series of exciting radical new ideas about relationships amongst

mammals and their inferred palaeo biogeographic history *Mammal-like Reptiles and the Origin of Mammals* Thomas Stainforth Kemp, 1982 *Mammalian Evolution, Diversity and Systematics* Frank Zachos, Robert Asher, 2018-10-22 There are nearly 6 000 mammalian species among them our own Research on our evolutionary cousins has a long history but the last 20 years have seen particularly rapid progress in disentangling the interrelationships and evolutionary history of mammals The present volume combines up to date reviews on mammalian phylogenetics with paleontological taxonomic and evolutionary chapters and also summarizes the historical development of our insights in mammalian relationships and thus our own place in the Tree of Life Our book places the present biodiversity crisis in context with one in four mammal species threatened by extinction and reviews the distribution and conservation of mammalian diversity across the globe This volume is the introductory tome to the new Mammalia series of the Handbook of Zoology and will be essential reading for mammalogists zoologists and conservationists alike *Encyclopedia of Evolutionary Biology*, 2016-04-14 Encyclopedia of Evolutionary Biology Four Volume Set is the definitive go to reference in the field of evolutionary biology It provides a fully comprehensive review of the field in an easy to search structure Under the collective leadership of fifteen distinguished section editors it is comprised of articles written by leading experts in the field providing a full review of the current status of each topic The articles are up to date and fully illustrated with in text references that allow readers to easily access primary literature While all entries are authoritative and valuable to those with advanced understanding of evolutionary biology they are also intended to be accessible to both advanced undergraduate and graduate students Broad topics include the history of evolutionary biology population genetics quantitative genetics speciation life history evolution evolution of sex and mating systems evolutionary biogeography evolutionary developmental biology molecular and genome evolution coevolution phylogenetic methods microbial evolution diversification of plants and fungi diversification of animals and applied evolution Presents fully comprehensive content allowing easy access to fundamental information and links to primary research Contains concise articles by leading experts in the field that ensures current coverage of each topic Provides ancillary learning tools like tables illustrations and multimedia features to assist with the comprehension process **The Origin of Higher Taxa** T.S. Kemp, 2015-12-16 In the grand sweep of evolution the origin of radically new kinds of organisms in the fossil record is the result of a relatively simple process natural selection marching through the ages Or is it Does Darwinian evolution acting over a sufficiently long period of time really offer a complete explanation or are unusual genetic events and particular environmental and ecological circumstances also involved With *The Origin of Higher Taxa* Tom Kemp sifts through the layers of paleobiological genetic and ecological evidence on a quest to answer this essential game changing question of biology Looking beyond the microevolutionary force of Darwinian natural selection Kemp enters the realm of macroevolution or evolution above the species level From the origin of mammals to the radiation of flowering plants these large scale patterns such as the rise of novel organismal design adaptive radiations and lineage extinctions encompass the most

significant trends and transformations in evolution As macroevolution cannot be studied by direct observation and experiment scientists have to rely on the outcome of evolution as evidence for the processes at work in the form of patterns of species appearances and extinctions in a spotty fossil record and through the nature of species extant today Marshalling a wealth of new fossil and molecular evidence and increasingly sophisticated techniques for their study Kemp here offers a timely and original reinterpretation of how higher taxa such as arthropods mollusks mammals birds and whales evolved a bold new take on the history of life

Beasts Before Us Elsa Panciroli, 2021-06-10 For most of us the story of mammal evolution starts after the asteroid impact that killed the dinosaurs but over the last 20 years scientists have uncovered new fossils and used new technologies that have upended this story In *Beasts Before Us* palaeontologist Elsa Panciroli charts the emergence of the mammal lineage Synapsida beginning at their murky split from the reptiles in the Carboniferous period over three hundred million years ago They made the world theirs long before the rise of dinosaurs Travelling forward into the Permian and then Triassic periods we learn how our ancient mammal ancestors evolved from large hairy beasts with accelerating metabolisms to exploit miniaturisation which was key to unlocking the traits that define mammals as we now know them Elsa criss crosses the globe to explore the sites where discoveries are being made and meet the people who make them In Scotland she traverses the desert dunes of prehistoric Moray where quarry workers unearthed the footprints of Permian creatures from before the time of dinosaurs In South Africa she introduces us to animals once called mammal like reptiles that gave scientists the first hints that our furry kin evolved from a lineage of egg laying burrowers In China new complete fossilised skeletons reveal mammals that were gliders shovel pawed Jurassic moles and flat tailed swimmers This book radically reframes the narrative of our mammalian ancestors and provides a counterpoint to the stereotypes of mighty dinosaur overlords and cowering little mammals It turns out the earliest mammals weren't just precursors they were pioneers

Mammalogy Terry A. Vaughan, James M. Ryan, Nicholas J. Czaplewski, 2013-12-11 *Mammalogy* is the study of mammals from the diverse biological viewpoints of structure function evolutionary history behavior ecology classification and economics Thoroughly updated the Sixth Edition of *Mammalogy* explains and clarifies the subject as a unified whole The text begins by defining mammals and summarizing their origins It moves on to discuss the orders and families of mammals with comprehensive coverage on the fossil history current distribution morphological characteristics and basic behavior and ecology of each family of mammals The third part of the text progresses to discuss special topics such as mammalian echolocation physiology behavior ecology and zoogeography The text concludes with two additional chapters previously available online that cover mammalian domestication and mammalian disease and zoonoses

[Origin, Evolution and Biogeographic History of South American Turtles](#) Marcelo S. de la Fuente, Juliana Sterli, Ignacio Maniel, 2013-10-17 The extended continental South American turtle record Norian to Lujanian allows us to follow the evolution of this reptile clade from its origins Several significant stem turtle taxa such as *Palaeochersis talampayensis* and *Condorchelys antiqua* provide

information on the first steps of turtle evolution Others such as *Chubutemys copelloi* or *Patagoniaemys gasparinae* provide clues to the origin of the bizarre horned tortoises of the clade Meiolaniidae The panpleurodiran species such as *Notoemys laticentralis* or *Notoemys zapatocaensis* shed light on the origin of modern pleurodiran turtles This book explores aquatic and terrestrial cryptodiran turtles South Gondwana pleurodiran turtles North Gondwana pleurodiran turtles Meiolaniforms and early differentiation of Mesozoic turtles

Mammals from the Age of Dinosaurs Zofia Kielan-Jaworowska, Richard L. Cifelli, Zhe-Xi Luo, 2004-11-24 The fossil record on Mesozoic mammals has expanded by orders of magnitude over the past quarter century New specimens some of them breathtakingly complete have been found in nearly all parts of the globe at a rapid pace Coupled with the application of new scientific approaches and techniques these exciting discoveries have led to profound changes in our interpretation of early mammal history Mesozoic mammals have come into their own as a rich source of information for evolutionary biology Their record of episodic successive radiations speaks to the pace and mode of evolution Early mammals were small but they provide key information on the morphological transformations that led to modern mammals including our own lineage of Placentalia Significant and fast evolving elements of the terrestrial biota for much of the Mesozoic early mammals have played an increasingly important role in studies of paleoecology faunal turnover and historical biogeography The record of early mammals occupies center stage for testing molecular evolutionary hypotheses on the timing and sequence of mammalian radiations Organized according to phylogeny this book covers all aspects of the anatomy paleobiology and systematics of all early mammalian groups in addition to the extant mammalian lineages extending back into the Mesozoic
