Population Ecology Of Individuals Monographs In Population Biology Series Vol 25:

Frontiers in Mathematical Biology Simon A. Levin, 2013-03-13 From a mathematical point of view physiologically structured population models are an underdeveloped branch of the theory of infinite dimensional dynamical systems We have called attention to four aspects i A choice has to be made about the kind of equations one extracts from the predominantly verbal arguments about the basic assumptions and subsequently uses as a starting point for a rigorous mathematical analysis Though differential equations are easy to formulate different mechanisms don't interact in infinitesimal time intervals and so end up as separate terms in the equations they may be hard to interpret rigorously as infinitesimal generators Integral equations constitute an attractive alternative ii The ability of physiologically structured population models to increase our understanding of the relation between mechanisms at the i level and phenomena at the p level will depend strongly on the development of dynamical systems lab facilities which are applicable to this class of models iii Physiologically structured population models are ideally suited for the formulation of evolutionary questions Apart from the special case of age see Charlesworth 1980 Yodzis 1989 Caswell 1989 and the references given there hardly any theory exists at the moment This will hopefully change rapidly in the coming years Again the development of appropriate software may turn out to be crucial

Fish Physiology, Fish Toxicology, and Fisheries Management Robert C. Ryans, 1990 **Applied Population Ecology** Andrew Paul Gutierrez, 1996-04-05 This book provides applied biologists and ecologists with the mathematical tools they need to understand the ever increasingly mathematical and complex area of population ecology **Subject Guide to Books in Print**, 1993 Ecology - Volume I Antonio Bodini, Stefan Klotz, 2009-10-20 Ecology is a component of Encyclopedia of Environmental and Ecological Sciences Engineering and Technology Resources in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty one Encyclopedias Ecology is the study of the interrelationships between living organisms and their environment The term ecology was introduced by Ernst Haeckel at the end of the nineteenth century Since that time spectacular advances have been made Much has been learned about the relationship between organisms and environmental factors and about the processes that regulate the abundance and distribution of species The Theme on Ecology with contributions from distinguished experts in the field discusses the Science of Ecology for a Sustainable World The two volumes are aimed at the following five major target audiences University and College students Educators Professional practitioners Research personnel and Policy analysts managers and decision makers and NGOs *Dynamic Systems and Applications*, 2000 *Achieving sustainable cultivation of rice Volume 2* Prof. Takuji Sasaki, 2017-05-22 Summarises advances in cultivation practices to close yield gaps including more efficient irrigation and nutrition techniques Discusses innovative methods of climate smart cultivation such as integrated crop management and the

Proceedings of the Third Berkeley Symposium on Mathematical Statistics and Probability, Volume IV Jerzy Neyman, 2023-11-15 *Oceanography and Marine Biology* Alan Ansell, Margaret Barnes, R N Gibson, R. N.

Gibson, 1998-10-09 *Oceanography and Marine Biology* an Annual Review considers basic areas of marine research returning to them when appropriate in future volumes and deals with subjects of special and topical importance in the field of marine biology The thirty sixth volume follows closely the objectives and style of the earlier well received volumes continued by

2003 *Population Parameters* Hamish McCallum, 2008-04-15 Ecologists and environmental managers rely on mathematical models both to understand ecological systems and to predict future system behavior In turn models rely on appropriate estimates of their parameters This book brings together a diverse and scattered literature to provide clear guidance on how to estimate parameters for models of animal populations It is not a recipe book of statistical procedures Instead it concentrates on how to select the best approach to parameter estimation for a particular problem and how to ensure that the quality estimated is the appropriate one for the specific purpose of the modelling exercise Commencing with a toolbox of useful generic approaches to parameter estimation the book deals with methods for estimating parameters for single populations These parameters include population size birth and death rates and the population growth rate For such parameters rigorous statistical theory has been developed and software is readily available The problem is to select the optimal sampling design and method of analysis The second part of the book deals with parameters that describe spatial dynamics and ecological interactions such as competition predation and parasitism Here the principle problems are designing appropriate experiments and ensuring that the quantities measured by the experiments are relevant to the ecological models in which they will be used This book will be essential reading for ecological researchers postgraduate students and environmental managers who need to address an ecological problem through a population model It is accessible to anyone with an understanding of basic statistical methods and population ecology Unique in concentrating on parameter estimation within modelling Fills a glaring gap in the literature Not too technical so suitable for the statistically inept Methods explained in algebra but also in worked examples using commonly available computer packages SAS GLIM and some more specialised packages where relevant Some spreadsheet based examples also included

Proceedings of the Third Berkeley Symposium on Mathematical Statistics and Probability Jerzy Neyman, 1956 Theoretical Ecology

Kevin S. McCann, Gabriel Gellner, 2020 *Theoretical Ecology* concepts and applications continues the authoritative and established sequence of theoretical ecology books initiated by Robert M May which helped pave the way for ecology to become a more robust theoretical science encouraging the modern biologist to better understand the mathematics behind their theories This latest instalment builds on the legacy of its predecessors with a completely new set of contributions Rather than placing emphasis on the historical ideas in theoretical ecology the Editors have encouraged each contribution to

synthesize historical theoretical ideas within modern frameworks that have emerged in the last 10-20 years e.g. bridging population interactions to whole food webs, describe novel theory that has emerged in the last 20 years from historical empirical areas e.g. macro ecology and finally to cover the rapidly expanding area of theoretical ecological applications e.g. disease theory and global change theory. The result is a forward looking synthesis that will help guide the field through a further decade of discovery and development. It is written for upper level undergraduate students, graduate students and researchers seeking synthesis and the state of the art in growing areas of interest in theoretical ecology, genetics, evolutionary ecology and mathematical biology.

Wildlife 2001: Populations D.R. McCullough, R.H. Barrett, 2012-12-06

In 1984 a conference called Wildlife 2000 Modeling habitat relationships of terrestrial vertebrates was held at Stanford Sierra Camp at Fallen Leaf Lake in the Sierra Nevada Mountains of California. The conference was well received and the published volume Verner J. M. L. Morrison and C. J. Ralph editors 1986 Wildlife 2000 modeling habitat relationships of terrestrial vertebrates University of Wisconsin Press Madison Wisconsin USA proved to be a landmark publication that received a book award by The Wildlife Society. Wildlife 2001 populations was a followup conference with emphasis on the other major biological field of wildlife conservation and management populations. It was held on July 29-31 1991 at the Oakland Airport Hilton Hotel in Oakland California in accordance with our intent that this conference have a much stronger international representation than did Wildlife 2000. The goal of the conference was to bring together an international group of specialists to address the state of the art in wildlife population dynamics and set the agenda for future research and management on the threshold of the 21st century. The mix of specialists included workers in theoretical as well as practical aspects of wildlife conservation and management. Three general sessions covered methods, modelling and conservation of threatened species.

Ecology, 1992 Handbook of Evolutionary Research in Archaeology Anna Marie Prentiss, 2019-06-03

Evolutionary Research in Archaeology seeks to provide a comprehensive overview of contemporary evolutionary research in archaeology. The book will provide a single source for introduction and overview of basic and advanced evolutionary concepts and research programs in archaeology. Content will be organized around four areas of critical research including microevolutionary and macroevolutionary process, human ecology, studies, evolutionary ecology, demography and niche construction and evolutionary cognitive archaeology. Authors of individual chapters will address theoretical foundations, history of research, contemporary contributions and debates and implications for the future for their respective topics. As appropriate, authors present or discuss short empirical case studies to illustrate key arguments.
