

quire protection from dust when running over, when running under, when running in a single direction, and when running in both directions for certain types of shafts. The standard type of bearing is the single row ball bearing. Any kind of ball bearing can be aligned to the shaft by the use of a special tool.

Special bearings. Bearings can be made with a metal sleeve seal on one or both sides. Figs. 12 and 13 show the "sealed" ball bearing or roller bearing. There is no standard size for which the bearing is made. An example of a bearing with a sleeve seal is shown in Fig. 12. It is a ball bearing with a sleeve seal on one side. It provides a way to clamp the bearing to the shaft.

Sizes and standards. The bearing sizes in the workshop range from those having bore sizes of 1/8 in. and up. They are standardized with a number of bore numbers. Sizes 6 to 9 are given in Fig. 13. Each bearing is made in four categories. Fig. 13, the light series

ball series being the most popular for all small power tools. Most manufacturers designate the light series as "200 series" and medium as "300 series." A No. 304 bearing is medium series, No. 4 bore. In practically all numbering codes, the two right-hand figures give the bore number or the bore size in millimeters. L or 1 in the third digit from the right indicates extra light series; 2 in light series; 3 is medium series; 4 is heavy series; 5 is nonloading groove light series; and 6 is nonloading groove medium series. Other numbers to the left indicate type or extra features. Small power-tool construction is mainly of the light series type. This is satisfactory for all average loads and does not require a bulky housing. A fair guide to the selection of a suitable bore size for any power tool is the motor rating given in Fig. 13. For example, if you are making a lathe to be driven with a 1-hp. motor, you would use No. 2 or 3 bore light series bearings. Of course, if you wanted a hollow spindle, you would have to take a bigger bore to accommodate the Morse taper.

Installation: In the basic installation, Fig. 17, both bearings are a press fit on the spindle and a push fit in the housing. The press fit should require about 30 lbs. pressure with an arbor press, or equivalent hammer force, Fig. 14. The turning allowance for press fitting taps, Fig. 14, should be about .0002 or .0003 over the bore size. Fig. 15, if the bearing is held with a lock nut, as shown in Fig. 17, a press fit of about 10 lbs. is sufficient. Both bearings are a push fit in the housing, which means that they can be pushed in by hand but there should be no looseness. A study of Fig. 17 will show that one bearing is clamped to the spindle and in the housing. The bearing fixes the spindle and takes up the thrust load. The other bearing, as stated before, is a press fit on the spindle and is a push, floating fit in the housing, which allows for shaft expansion. Press-fit bearings are commonly driven on with a piece of pipe, Fig. 14. Fig. 15 suggests suitable pipe sizes for the bores of various bearings. Heat often is used to expand the bearing so that it can be pushed on by hand for a shrink fit. A 60-watt bulb, Fig. 16, gives off about 240 deg. F. heat and can be used in some cases. Immersion in an oil bath is sometimes used to heat bearings but care should be taken in either case not to use too high a heat.
