## **River Basin Modelling For Flood Risk Mitigation:**

River Basin Modelling for Flood Risk Mitigation Donald Knight, Asaad Shamseldin, 2005-11-17 Flooding accounts for one third of natural disasters worldwide and for over half the deaths which occur as a result of natural disasters. As the frequency and volume of flooding increases as a result of climate change, there is a new urgency amongst researchers and professionals working in flood risk management. River Basin Modelling for Flood Risk Mitigation brings together thirty edited papers by leading experts who gathered for the European Union's Advanced Study Course at the University of Birmingham, UK. The scope of the course ranged from issues concerning the protection of life to river restoration and wetland management. A variety of topics is covered in the book including climate change, hydro informatics, hydro meteorology, river flow forecasting systems and dam break modelling. The approach is broad but integrated, providing an attractive and informative package that will satisfy researchers and professionals while offering a sound introduction to students in Engineering and Geography.

Practical Channel Hydraulics, 2nd edition Donald W. Knight, Caroline Hazlewood, Rob Lamb, Paul G. Samuels, Koji Shiono, 2018-03-05 Practical Channel Hydraulics is a technical guide for estimating flood water levels in rivers using the innovative software known as the Conveyance and Afflux Estimation System (CES/AES). The stand alone software is freely available at HR Wallingford's website [www.riverconveyance.net](http://www.riverconveyance.net). The conveyance engine has also been embedded within industry standard river modelling software such as InfoWorks RS and Flood Modeller Pro. This 2nd Edition has been greatly expanded through the addition of Chapters 6-8 which now supply the background to the Shiono and Knight Method (SKM) upon which the CES/AES is largely based. With the need to estimate river levels more accurately, computational methods are now frequently embedded in flood risk management procedures, as for example in ISO 18320 Determination of the stage-discharge relationship in which both the SKM and CES feature. The CES/AES incorporates five main components: A Roughness Adviser, A Conveyance Generator, an Uncertainty Estimator, a Backwater Module and an Afflux Estimator. The SKM provides an alternative approach solving the governing equation analytically or numerically using Excel or with the short FORTRAN program provided. Special attention is paid to calculating the distributions of boundary shear stress distributions in channels of different shape and to appropriate formulations for resistance and drag forces including those on trees in floodplains. Worked examples are given for flows in a wide range of channel types, size, shape, cover, sinuosity ranging from small scale laboratory flumes ( $Q = 2.0 \text{ l/s}$ ) to European rivers ( $2,000 \text{ m}^3/\text{s}$ ) and large scale world rivers ( $23,000 \text{ m}^3/\text{s}$ ) a  $10^7$  range in discharge. Sites from rivers in the UK, France, China, New Zealand and Ecuador are considered. Topics are introduced initially at a simplified level and get progressively more complex in later chapters. This book is intended for post graduate level students and practising engineers or hydrologists engaged in flood risk management as well as those who may simply just wish to learn more about modelling flows in rivers.

*Flood Risk Management: Hazards, Vulnerability and Mitigation Measures* Jochen Schanze, Evzen Zeman, Jiri Marsalek, 2007-09-17 Floods are of increasing public concern world wide due to

increasing damages and unacceptably high numbers of injuries Previous approaches of flood protection led to limited success especially during recent extreme events Therefore an integrated flood risk management is required which takes into consideration both the hydrometeorological and the societal processes Moreover real effects of risk mitigation measures have to be critically assessed The book draws a comprehensive picture of all these aspects and their interrelations It furthermore provides a lot of detail on earth observation flood hazard modelling climate change flood forecasting modelling vulnerability mitigation measures and the various dimensions of management strategies In addition to local and regional results of science engineering and social science investigations on modelling and management transboundary co operation of large river catchments are of interest Based on this the book is a valuable source of the state of the art in flood risk management but also covers future demands for research and practice in terms of flood issues
