When geophysicist Alfred Wegener suggested in 1912 that the continents were moving, the idea seemed fantastic. There was no way to explain the idea. Only a half-century later, plate tectonic theory was able to offer an explanation of the phenomenon, volcanic activity on the ocean floor, convection currents, and the melting of rock in the mantle power the continental drift that is still making the planet's surface today.

## Continental Drift

The first ideas on continental drift came from the continents themselves. The continents moved. They were not always where they are now. They had once been joined together in a single land mass. The continents were not always where they are now. They had once been joined together in a single land mass. The continents were not always where they are now. They had once been joined together in a single land mass.

## The Hidden Motor

Convection currents of molten rock in the mantle drive the continents. The continents are not always where they are now. They had once been joined together in a single land mass. The continents were not always where they are now. They had once been joined together in a single land mass.
