## **Measles Virus:**

Measles Virus and Its Biology K. B. Fraser, S J Martin, 2013-09-17 Measles Virus and Its Biology deals with the biological and clinical problems of the viral disease measles This book also describes the behavior of the measles virus in terms of its immunological biochemical or molecular biological aspects The authors review the epidemiology and pathogenesis of measles and discuss how the virus flourishes and mobilizes in the human body through a close association with leukocytes and lymphoid organs Biological characters and genetic markers of the virus can serve to separate different isolates of the measles virus from one another Radioactive labeling techniques have detected six structural proteins associated with the virus a schematic diagram in the book shows the structural components and the biochemical dissection of the virus The authors also discuss that the various immune responses to the virus can be due to variation in the patient rather than virus mutation The authors do not discount that the physiological behavior of the virus such as its location number or replication can also affect the host This text is suitable for the clinical research workers dealing with immunology infectious diseases cellular chemistry or molecular biology

**Measles** Diane E. Griffin, Michael B. A. Oldstone, 2008-10-30 Measles virus one of the most contagious of all human viruses has been largely contained by the development and use of a vaccine that was introduced 50 years ago These two volumes were timed to honor the introduction of the vaccine and to record the enormous advancements made in understanding the molecular and cell biology pathogenesis and control of this infectious disease Where vaccine has been effectively delivered endemic measles virus transmission has been eliminated However difficulties in vaccine delivery lack of health care support and objection to vaccination in some communities continue to result in nearly 40 million cases and over 300 000 deaths per year from measles

Receptor usage and pathogenesis in acute and chronic viral infection Yasuko Tsunetsugu-Yokota, Kazutaka Terahara, In the first phase of the viral life cycle the virus enters cells using a specific cell surface receptor Many viruses use multiple receptors some of which are unique to a certain cell type while others are ubiquitous in many cell types Depending on the receptors used the viral cell tropism is determined which may result in the characteristic distribution of virus infected cells tissues Obviously virus entry is not the whole story After the virus enters various cellular proteins interact with it some support virus replication while others inhibit it The intrinsic anti viral cellular machinery differs among cell types thus viral cell tropism based on the receptor usage plays an important role in the pathogenesis For example HIV 1 utilizes one of two co receptors CXCR4 or CCR5 in addition to a major receptor CD4 CCR5 expression is restricted to a certain subset of memory CD4 T cells while CXCR4 expression is rather ubiquitous among CD4 T cells Therefore the latent infection of CCR5 utilizing HIV 1 in resting memory CCR5 T cells would be largely responsible for intermittent virus blimps accompanied by immune activation during chronic HIV infection This may explain why CCR5 utilizing HIV 1 is preferentially isolated in the early phase of HIV 1 infection even when the HIV 1 transmitter carries CXCR4 utilizing HIV 1 in abundance In the case of the measles virus CD150 Signaling Lymphocyte Activation Molecule SLAM is a major receptor while vaccine strains utilize CD46 when CD150 is not available The third possible entry receptor would also be utilized for the infection of lung epithelial cells The impact of these receptor usages in vivo on the disease outcome is now under investigation We also know that the distinct use of host

cell sugar moieties mediates species tropism in the influenza virus and that a mutant virus breaking the species barrier is highly pathogenic in humans Thanks to the recent development of reverse genetics it is now possible to visualize virus infected cells or even the virus itself by using highly sensitive flow cytometry or microscopy How viral cell tropism determined by the receptor used can affect the disease course of acute and chronic virus infection is an important question to address In this Research Topic we focus on studies connecting virus receptor usage and the pathogenesis of various viruses causing acute or chronic infection      **Emerging Infectious Diseases** ,2005      **Public Health Service Publication** ,
