**Measurement and Interpretation in Accounting** G A Swanson, James Miller, 1989-10-25 For many years the accounting profession has attempted to construct a conceptual framework that logically ties together its many ideas and procedures As this systems view of accounting emerges it is important argue Swanson and Miller to make the distinction between opinion or personal interpretation and empirical evidence In this pioneering book they develop a coherent theory of accounting measurement based on living systems theory LST and thus provide a fundamental framework for classifying the various accounting ideas and procedures into those that concern measurements of concrete economic processes and interpretations of those measurements Writing for advanced students of accounting and finance the authors explain the distinctions among concrete abstracted and conceptual systems discuss the concept of money in terms of concrete processes and survey the connections between twenty LST defined subsystems and accounting information systems Contrary to most modern accounting theory they assert that the monetary scale is a ratio level measurement scale fully analogous to other measurement scales used by science They reject the idea that the units of the scale are variable and show that this general perception arises from the fallacy of confusing the objects being measured with the units of the measurement scale Using this scale accounting s unique contribution to information processing is enabling managers and other social deciders to view the diverse matter energy forms of a complex organization as a coherent whole on the attribute specific exchange value Finally Swanson and Miller analyze generally accepted accounting principles highlighting areas in which the distinction between interpretation and empirical evidence is blurred in practice They present an extended critique of the usefulness of such principles and propose new alternatives based on living systems theory that will improve both our understanding of accounting methods and measurements and the quality of accounting reporting Numerous tables and figures enhance the presentation

*Systems Science and Cybernetics - Volume I* Francisco Parra-Luna, 2009-10-30 The subject Systems sciences and cybernetics is the outcome of the convergence of a number of trends in a larger current of thought devoted to the growing complexity of primarily social objects and arising in response to the need for globalized treatment of such objects This has been magnified by the proliferation and publication of all manner of quantitative scientific data on such objects advances in the theories on their inter relations the enormous computational capacity provided by IT hardware and software and the critical revisiting of subject object interaction not to mention the urgent need to control the efficiency of complex systems where efficiency is understood to mean the ability to find a solution to many social problems including those posed on a planetary scale The result has been the forging of a new academically consolidated scientific trend going by the name of Systems Theory and Cybernetics with a comprehensive multi disciplinary focus and therefore apt for understanding realities still regarded to be inescapably chaotic This subject entry is subdivided into four sections The first an introduction to systemic theories addresses the historic development of the most commonly used systemic approaches from new concepts

such as the so called geometry of thinking or the systemic treatment of non systemic identities to the taxonomic entropic axiological and ethical problems deriving from a general systemic cybernetic conceit Hence the focus in this section is on the historic and philosophical aspects of the subject Moreover it may be asserted today that beyond a shadow of a doubt problems in particular problems deriving from human interaction but in general any problem regardless of its nature must be posed from a systemic perspective for otherwise the obstacles to their solution are insurmountable Reaching such a perspective requires taking at least the following well known steps a statement of the problem from the determinant variables or phenomena b adoption of theoretical models showing the interrelationships among such variables c use of the maximum amount of wherever possible quantitative information available on each d placement of the set of variables in an environment that inevitably pre determines the problem That epistemology would explain the substantial development of the systemic cybernetic approach in recent decades The articles in the second section deal in particular with the different methodological approaches developed when confronting real problems from issues that affect humanity as a whole to minor but specific questions arising in human organizations Certain sub themes are discussed by the various authors always from a didactic vantage including problem discovery and diagnosis and development of the respective critical theory the design of ad hoc strategies and methodologies the implementation of both qualitative soft system methodologies and formal and quantitative such as the General System Problem Solver or the axiological operational perspective approaches cross disciplinary integration and suitable methods for broaching psychological cultural and socio political dynamisms The third section is devoted to cybernetics in the present dual meaning of the term on the one hand control of the effectiveness of communication and actions and on the other the processes of self production of knowledge through reflection and the relationship between the observing subject and the observed object when the latter is also observer and the former observed Known as second order cybernetics this provides an avenue for rethinking the validity of knowledge such as for instance when viewed through what is known as bipolar feedback processes through which interactions create novelty complexity and diversity Finally the fourth section centres around artificial and computational intelligence addressing sub themes such as neural networks the simulated annealing that ranges from statistical thermodynamics to combinatory problem solving such as in the explanation of the role of adaptive systems or when discussing the relationship between biological and computational intelligence

*Measurement and Interpretation in Accounting* G A Swanson, James Miller, 1989-10-25 For many years the accounting profession has attempted to construct a conceptual framework that logically ties together its many ideas and procedures As this systems view of accounting emerges it is important argue Swanson and Miller to make the distinction between opinion or personal interpretation and empirical evidence In this pioneering book they develop a coherent theory of accounting measurement based on living systems theory LST and thus provide a fundamental framework for classifying the various accounting ideas and procedures into those that concern measurements of concrete economic

processes and interpretations of those measurements Writing for advanced students of accounting and finance the authors explain the distinctions among concrete abstracted and conceptual systems discuss the concept of money in terms of concrete processes and survey the connections between twenty LST defined subsystems and accounting information systems Contrary to most modern accounting theory they assert that the monetary scale is a ratio level measurement scale fully analogous to other measurement scales used by science They reject the idea that the units of the scale are variable and show that this general perception arises from the fallacy of confusing the objects being measured with the units of the measurement scale Using this scale accounting s unique contribution to information processing is enabling managers and other social deciders to view the diverse matter energy forms of a complex organization as a coherent whole on the attribute specific exchange value Finally Swanson and Miller analyze generally accepted accounting principles highlighting areas in which the distinction between interpretation and empirical evidence is blurred in practice They present an extended critique of the usefulness of such principles and propose new alternatives based on living systems theory that will improve both our understanding of accounting methods and measurements and the quality of accounting reporting Numerous tables and figures enhance the presentation
