Moura Branco, R. Ritchie, V. Sklenicka, 1996-06-30 This volume contains the edited version of lectures and selected research contributions presented at the NATO ADVANCED STUDY INSTITUTE on MECHANICAL BEHAVIOUR OF MATERIALS AT HIGH TEMPERATURE held in Sesimbra Portugal 12th 22nd September 1995 and organized by 1ST Lisbon Institute of Technology Portugal The Institute was attended by 88 participants including 15 lecturers from 17 countries including five CP countries The lecturers were leading scientists and technologists from universities research institutions and industry The students were mainly young PhD students and junior academic or research staff with postgraduate qualifications MSc or PhD Fourteen students were from the five CP countries The students presented research papers or posters during the Institute reporting the current progress of their research projects A total of thirty three lectures ten research papers and fifty posters were presented This book does not contain the poster presentations and seven research papers were selected for publication All the sessions were very active and quite extensive discussions on scientific aspects took place during the Institute The Advanced Study Institute provided a forum for interaction among scientists and engineers from different areas of research and young researchers

preparation production process However the production of materials featuring high levels of the required properties without the necessity to use costly alloying elements or time and money demanding heat treatment technologies typically used to enhance the mechanical properties of metallic materials especially specific strength still remains a challenge The introduction of thermomechanical treatment represented a breakthrough in grain refinement consequently leading to significant improvement of the mechanical properties of metallic materials Contrary to conventional production technologies the main advantage of such treatment is the possibility to precisely control structural phenomena that affect the final mechanical and utility properties Thermomechanical treatment can only decrease the grain size to the scale of microns However further research devoted to pushing materials performance beyond the limits led to the introduction of severe plastic deformation SPD methods providing producers with the ability to acquire ultra fine grained and nanoscaled metallic materials with superior mechanical properties SPD methods can be performed with the help of conventional forming equipment however many newly designed processes have also been introduced
