Computation Theory and Logic Egon Börger, 1987-07-29 In Memory of Dieter Rittinger 24.8.1937 - 4.6.1984 On the Occasion of the 50th Anniversary of His Birth *Graph-Theoretic Concepts in Computer Science* Gottfried Tinhofer, Gunther Schmidt, 1987 Graph theoretic concepts are developed by computer scientists in order to model algorithms, nets, rewriting systems, distributed systems, parallelism, geometric and layout concepts. Their complexity is studied under various randomness assumptions. This volume contains contributions to the twelfth of a series of annual workshops designed to bring together researchers using graph theoretic methods. Its purpose is to broadcast emerging new developments from and to a diversity of application fields. The topics covered include Graph Grammars, Graph Manipulation, Nets, Complexity Issues, Algorithmic and Network Considerations, Outerplanar Graphs, Graph Isomorphism, Parallelism and Distributed Systems, Graphs and Geometry, Randomness Considerations, Applications in Chemistry, Specific Algorithms. Mental Models and Human-Computer Interaction Martin G. Tauber, D. Ackermann, 2013-10-22 Nowadays mental models are seen as crucial in systems design. Research is driven by the assumption that a better insight into a user's cognitive processes when using a system will improve design methods and provide friendly and efficient interfaces. The papers in this volume explore three fundamental issues: understanding the complexity of the intended worksystem, describing it by models, and finally building the required powerful and usable system. The papers are an edited selection of those presented at the 8th interdisciplinary workshop on Mental Models and HCI held in Austria in June 1989. They concentrate primarily on design issues, their theoretical background, and the application of the concept of Human-Computer Interaction (HCI). Nevertheless, there are also contributions on theoretical topics and methodological questions.

Petri Nets: Central Models and Their Properties Wilfried Brauer, Wolfgang Reisig, Grzegorz Rozenberg, 2006-04-11 Petri Nets represent a long and sustained effort to develop concepts, theories, and tools to aid in design and analysis of concurrent systems. They are used in many areas of computer science, including software engineering, data base and information systems, computer architecture and operating systems, communication protocols, and computer networks, process control, and socio-technical systems such as office communication and man-machine interaction. Quite substantial theory has been developed for Petri Nets. It reflects all major problem areas of concurrent distributed systems and covers many successfully applied principles and analysis techniques for systems organisation. Since the time that C. A. Petri has presented his original ideas, a rich body of knowledge has been developed. A recent bibliography in *Advances in Petri Nets* 1981 includes more than 2000 entries. Already in 1979 an Advanced Course on Petri Nets was organized in Hamburg, West Germany, aiming at systematizing the existing knowledge and making it well accessible to a wide audience of computer scientists interested in theory and applications of concurrent systems. This course has turned out to be successful in the sense that it has initiated a lot of new research into applications and theory of Petri Nets. This had led to another Advanced Course in 1986 in Bad Honnef, West Germany, where during two weeks more than 30 lectures were presented.

covering the most important current developments in the area of Petri Nets **Logic Programming '86** Eiti Wada,1987-06-03 This volume contains the papers presented and subsequently submitted for publication at the 5th Logic Programming Conference held June 23 26 1986 in Tokyo Topics covered include Prolog machine architecture Prolog processors variations of Prolog language and applications of Prolog to natural language understanding and expert systems Most of the works reported in the volume are related to the Japanese Fifth Generation Computer Project allowing readers to compare results from this project with those from similar projects currently being conducted in other countries

Automata, Languages and Programming Thomas Ottmann,1987-07-08 This volume contains the proceedings of the 14th International Colloquium on Automata Languages and Programming organized by the European Association for Theoretical Computer Science EATCS and held in Karlsruhe July 13 17 1987 The papers report on original research in theoretical computer science and cover topics such as algorithms and data structures automata and formal languages computability and complexity theory semantics of programming languages program specification transformation and verification theory of data bases logic programming theory of logical design and layout parallel and distributed computation theory of concurrency symbolic and algebraic computation term rewriting systems cryptography and theory of robotics The authors are young scientists and leading experts in these areas *A Review of Ada Tasking* Alan Burns,Andrew M. Lister,Andrew J. Wellings,1987-06-24 Ada is unquestionably one of the most significant programming languages to emerge in the last decade The manner of its inception and support by the US Department of Defense DoD ensures that it will be used extensively for the indefinite future in programming large and complex systems The growing availability of compilers means that many organisations are already committed to using the language for sizable and significant applications As a perhaps inevitable result of its design goals Ada is a large language It has Pascal like control and type constructs a mechanism for exception handling a package structure for information hiding decomposition and separate compilation facilities for low level programming and a tasking model of concurrency It is perhaps this last area that has generated most debate criticism and disagreement The purpose of this book is to review the tasking model in the light of the extensive analysis and comment which has appeared in the literature The review is necessarily wide ranging including discussion of Ada as a general purpose concurrent programming language Ada as a language for embedded and distributed systems implementation issues with particular reference to distributed systems formal semantics specification and verification proposed language modifications By consolidating this discussion within the confines of a single review potential users of the tasking facility are enabled to familiarise themselves with all the factors which may impinge upon the performance reliability and correctness of their software The book also provides a focus for any debate on modifications to the Ada language or developments from it

Recommendation Systems in Software Engineering Martin P. Robillard,Walid Maalej,Robert J. Walker,Thomas Zimmermann,2014-04-30 With the growth of public and private data stores and the emergence of off the shelf data mining

technology recommendation systems have emerged that specifically address the unique challenges of navigating and interpreting software engineering data This book collects structures and formalizes knowledge on recommendation systems in software engineering It adopts a pragmatic approach with an explicit focus on system design implementation and evaluation The book is divided into three parts Part I Techniques introduces basics for building recommenders in software engineering including techniques for collecting and processing software engineering data but also for presenting recommendations to users as part of their workflow Part II Evaluation summarizes methods and experimental designs for evaluating recommendations in software engineering Part III Applications describes needs issues and solution concepts involved in entire recommendation systems for specific software engineering tasks focusing on the engineering insights required to make effective recommendations The book is complemented by the webpage rsse.org book which includes free supplemental materials for readers of this book and anyone interested in recommendation systems in software engineering including lecture slides data sets source code and an overview of people groups papers and tools with regard to recommendation systems in software engineering The book is particularly well suited for graduate students and researchers building new recommendation systems for software engineering applications or in other high tech fields It may also serve as the basis for graduate courses on recommendation systems applied data mining or software engineering Software engineering practitioners developing recommendation systems or similar applications with predictive functionality will also benefit from the broad spectrum of topics covered

WOPPLOT 86 Parallel Processing: Logic, Organization, and Technology Jörg D. Becker, Ignaz Eisele, 1987 WOPPLOT 86 Workshop on Parallel Processing Logic Organization and Technology gathered together experts from various fields for a broad overview of current trends in parallel processing There are contributions from logic e.g the connection between time and logic or non monotonic reasoning from organizational structure theory of great importance for pyramid architecture and structure representation from intrinsic parallelism and problem classification from developments in future technologies 3 D Silicon technology molecular electronics and from various applications pattern storage in adaptive memories simulation of physical systems The proceedings show clearly that progress in parallel processing is an interdisciplinary goal they present a cross section of the state of the art as well as of future trends Furthermore some

contributions in particular those from logic and organization deserve a broader interest also outside the field of parallel processing
