RECENT RESULTS ON SEMI-LINEAR HYPERBOLIC PROBLEMS IN BOUNDED DOMAINS

A. HARAUX[*]

1. GENERALITIES

Let Ω be a bounded open domain in $\mathbb{R}^n$, $n \geq 1$ and f, g two _odd_ functions: $\mathbb{R} \to \mathbb{R}$ such that,

(1.1) $\qquad f \in C^1(\mathbb{R})$, $f' \geq 0$

(1.2) $\qquad g$ is continuous and non-decreasing.

The partial differential equation

(1.3) $\qquad \begin{cases} \dfrac{\partial^2 u}{\partial t^2} - \Delta u + f(u) + g(\frac{\partial u}{\partial t}) = h(t, x), & (t, x) \in \mathbb{R}^+ \times \Omega \\[2mm] u(t, x) = 0 & (t, x) \in \mathbb{R}^+ \times \partial\Omega \end{cases}$

represents the small oscillations of an n-dimensional membrane with fixed edge $\{0\} \times \partial\Omega$ under the action of 4 forces

— The elastic (global, distributed) force represented by Δu.

— A non linear _restoring_ _force_ $-f(u)$, of local character.

— A _damping_ _force_ $-g(\frac{\partial u}{\partial t})$, possibly non linear, also of local character.

— An exterior time-dependent force density $h(t, x)$.

The physical interpretation of (1.3) suggests that the initial value problem must be well set in the function space $C(\mathbb{R}^+, H_0^1(\Omega)) \cap \cap C^1(\mathbb{R}^+, L^2(\Omega))$ and that the _total energy_ given by

(1.4) $\qquad E(t) = \displaystyle\int_\Omega \left\{ \frac{1}{2} (\frac{\partial u}{\partial t})^2 + \frac{1}{2} |\Delta u|^2 + \int_0^{u(t, x)} f(s)ds \right\} dx$

must play an important role in the definition of solutions to (1.3).

Equation (1.3) has been studied by a number of authors since 1953. More precisely, the initial-value problem has been studied successively

F. Roach,I. G. Stratis,A. N. Yannacopoulos,2012-03-04 Electromagnetic complex media are artificial materials that affect the propagation of electromagnetic waves in surprising ways not usually seen in nature Because of their wide range of important applications these materials have been intensely studied over the past twenty five years mainly from the perspectives of physics and engineering But a body of rigorous mathematical theory has also gradually developed and this is the first book to present that theory Designed for researchers and advanced graduate students in applied mathematics electrical engineering and physics this book introduces the electromagnetics of complex media through a systematic state of the art account of their mathematical theory The book combines the study of well posedness homogenization and controllability of Maxwell equations complemented with constitutive relations describing complex media The book treats deterministic and stochastic problems both in the frequency and time domains It also covers computational aspects and scattering problems among other important topics Detailed appendices make the book self contained in terms of mathematical prerequisites and accessible to engineers and physicists as well as mathematicians   *Energy Methods in Continuum Mechanics* S.N.
