Sensor Modelling Design And Data Processing For Autonomous Navigation In Confined Environments:

Sensor Modelling, Design and Data Processing for Autonomous Navigation Martin David Adams, 1999 This invaluable book presents an unbiased framework for modelling and using sensors to aid mobile robot navigation. It addresses the problem of accurate and reliable sensing in confined environments and makes a detailed analysis of the design and construction of a low cost optical range finder. This is followed by a quantitative model for determining the sources and propagation of noise within the sensor. The physics behind the causes of erroneous data is also used to derive a model for detecting and labelling such data as false. In addition, the author's data processing algorithms are applied to the problem of environmental feature extraction. This forms the basis of a solution to the problem of mobile robot localisation. The book develops a relationship between the kinematics of a mobile robot during the execution of successive manoeuvres and the sensed features. Results which update a mobile vehicle's position using features from 2D and 3D scans are presented.

Sci-tech News, 1999 *Fuzzy Logic Techniques for Autonomous Vehicle Navigation* Dimitar Driankov, Alessandro Saffiotti, 2013-03-09 In the past decade a critical mass of work that uses fuzzy logic for autonomous vehicle navigation has been reported. Unfortunately reports of this work are scattered among conference workshop and journal publications that belong to different research communities: fuzzy logic, robotics, artificial intelligence, intelligent control, and it is therefore not easily accessible either to the new comer or to the specialist. As a result researchers in this area may end up reinventing things while being unaware of important existing work. We believe that research and applications based on fuzzy logic in the field of autonomous vehicle navigation have now reached a sufficient level of maturity and that it should be suitably reported to the largest possible group of interested practitioners, researchers and students. On these grounds we have endeavored to collect some of the most representative pieces of work in one volume to be used as a reference. Our aim was to provide a volume which is more than yet another random collection of papers and gives the reader some added value with respect to the individual papers. In order to achieve this goal we have aimed at selecting contributions which are representative of a

wide range of problems and solutions and which have been validated on real robots and Setting the individual contributions in a clear framework that identifies the main problems of autonomous robotics for which solutions based on fuzzy logic have been proposed
