### **Wireless Sensor Networks. Routing Protocol Overview**

Madhumathy Perumal,R. Umamaheswari,2020-11-27 Document from the year 2020 in the subject Engineering Computer Engineering language English abstract Sensor nodes have restricted storage computational and energy resources these restrictions place a limit on the types of deployable routing mechanisms Routing protocol disseminates information that enables the sensor nodes to select routes to communicate with other nodes on the network and the choice of the route is determined by the routing algorithms Thus the routing protocol helps the nodes to gain knowledge about the topology of the network to which it is attached directly There are mainly two types of routing processes one is static routing and the other is dynamic routing In a static routing the routing tables are set up in a static manner in the nodes The network routes for the packet are initially set between the nodes However if any node on the specified route fails the data may not reach the destination In a dynamic routing routing tables in the routers often change whenever the possible routes change Dynamic routing is more suitable as the nodes in WSNs may frequently change their position and die at any moment The routing protocols are classified into single hop and multi hop routing In a single hop routing sensor node directly communicates with the sink to share the gathered information Energy consumption is high in the network using single hop protocol In multi hop routing data is routed through the intermediate nodes to the base station Each node transfers sensed data to the immediate node which in turn transfers the data to the next immediate node and finally the data reaches the base station Energy consumption in this kind of routing protocol is less and thus the lifetime of the nodes is high The major challenge to the efficient operation of wireless sensor network lies in its ability to deliver the sensed information from the nodes to the sink within the specific time duration without the loss of data packets

Smart Wireless Sensor Networks Yen Kheng Tan, Hoang Duc Chinh, 2010-12-14 The recent development of communication and sensor technology results in the growth of a new attractive and challenging area wireless sensor networks WSNs A wireless sensor network which consists of a large number

of sensor nodes is deployed in environmental fields to serve various applications. Facilitated with the ability of wireless communication and intelligent computation, these nodes become smart sensors which do not only perceive ambient physical parameters but also be able to process information, cooperate with each other and self-organize into the network. These new features assist the sensor nodes as well as the network to operate more efficiently in terms of both data acquisition and energy consumption. Special purposes of the applications require design and operation of WSNs different from conventional networks such as the internet. The network design must take into account of the objectives of specific applications. The nature of deployed environment must be considered. The limited resources of sensor nodes such as memory, computational ability, communication bandwidth and energy source are the challenges in network design. A smart wireless sensor network must be able to deal with these constraints as well as to guarantee the connectivity, coverage, reliability and security of network's operation for a maximized lifetime. This book discusses various aspects of designing such smart wireless sensor networks. Main topics include design methodologies, network protocols and algorithms, quality of service, management, coverage, optimization, time synchronization and security techniques for sensor networks. *Wireless Sensor Networks* Jr., Edgar H. Callaway, 2003-08-26. Because they provide practical machine-to-machine communication at a very low cost, the popularity of wireless sensor networks is expected to skyrocket in the next few years, duplicating the recent explosion of wireless LANs. *Wireless Sensor Networks: Architectures and Protocols* describes how to build these networks from the layers of the

*Comparative Analysis of Network Protocols for Wireless Sensor Networks* Mohammed Abdulaziz Almeer, 2014. This dissertation proposes a methodology for performance evaluation and comparison of Wireless Sensor Network (WSN) protocols. The methodology is simulation-based and it examines the protocols' lifetime, scalability, fault tolerance and the affect of multiple sinks. Both the evaluation and the comparison consider the network lifetime, both the number of rounds before the death of the first node and the number of rounds before the death of the last node, the energy dissipation rate and the nodes' death rate. The methodology is conducted on LEACH, TEEN, APTEEN and REE-LEACH protocols. The proposed methodology provides a better understanding of the protocols' behavior. This study emphasizes on some information that helps WSN designers to take decisions. Besides which protocol lives longer, the designers should consider other details about these protocols. Such as the death rate and energy dissipation rate should be considered for redeployment decision. Furthermore, the designers should consider the affect of enlarging the network not only on the rounds for first or last death but also they should consider the affect on the ratio between the first and last deaths rounds. Moreover, there are other findings that help the WSN users and designers to take adopting a protocol decisions. Furthermore, the analysis conducted in this research proves and supports some of the main attributes of the protocols that are claimed in the literature. Such as the equality of percentage between the failing nodes and the lost energy by failure and the affect of multi-sink on the death rates prove that the protocols have a good level of load balancing. Furthermore, the changes in the death rate and energy dissipation rate

mean a good level of fault tolerance In general the proposed methodology provides better understanding of the protocols Furthermore it provides abundant amount of information to determine protocol suitability for different WSN applications Moreover this extended analysis reveals drawbacks that should be considered in future works **Wireless Ad hoc and Sensor Networks** Jagannathan Sarangapani,2017-12-19 With modern communication networks continuing to grow in traffic size complexity and variety control systems are critical to ensure quality and effectively manage network traffic Providing a thorough and authoritative introduction Wireless Ad hoc and Sensor Networks Protocols Performance and Control examines the theory architectures and technologies needed to implement quality of service QoS in a wide variety of communication networks Based on years of research and practical experience this book examines the technical concepts underlying the design implementation research and invention of both wired and wireless networks The author builds a strong understanding of general concepts and common principles while also exploring issues that are specific to wired cellular wireless ad hoc and sensor networks Beginning with an overview of networks and QoS control he systematically explores timely areas such as Lyapunov analysis congestion control of high speed networks admission control based on hybrid system theory distributed power control of various network types link state routing using QoS parameters and predictive congestion control The book also provides a framework for implementing QoS control using mote hardware Providing a deeply detailed yet conveniently practical guide to QoS implementation Wireless Ad hoc and Sensor Networks Protocols Performance and Control is the perfect introduction for anyone new to the field as well as an ideal reference guide for seasoned network practitioners
