

# Lateral Inhibition

Receptors that are most strongly stimulated inhibit those around them.

This allows us to perceive well-defined sensations at a single location instead of a "fuzzy" border

This process occurs in the CNS, where interneurons that pass between sensory neurons are inhibitory.

Lateral inhibition allows us to distinguish different pitches, closely related odors, or the borders of light and darkness, for example.

**Sensory Inhibition** Georg Von Békésy, 2017-03-14 Psychological experiments carried out over a period of nearly forty years led Georg von Békésy to realize that inhibition interconnects at least in one respect the fields of vision hearing skin sensations taste and smell This book indeed almost creates the field of sensory inhibition as a significant one for study bringing understanding to many observations that formerly seemed uncertain or unrelated and raising many problems still to be solved Originally published in 1967 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905
