Sensory Processes At The Neuronal And Behavioral Levels:

Sensory Processes at the Neuronal and Behavioral Levels G. V. Gersuni, 2013-09-11 *Sensory Processes at the Neuronal and Behavioral Levels* is a collection of papers dealing with problems of functional organization of the visual and auditory systems One paper points out that neurophysiological and psychophysiological research in vision can be combined The paper compares the cat's contrast stimulation by Hermann's grid that elicits neuronal responses of cells with concentric and simple fields as being similar to the subjective vision in man Another paper addresses the sources of information in the perception of visual spatial relations For example eye movements as the source of information about visual spatial relations are refuted The visual system already estimates accurately the spatial properties of an object before the onset of eye movements Another paper discusses certain concepts about the mechanisms of the auditory system One paper presents the results of an experiment involving some adult cats They were lightly anesthetized and their responses were recorded when the inferior colliculus or the left and right auditory cortex were stimulated electrically Another paper analyzes the mechanism used by insect in recognizing species specific songs This book is suitable for neurophysiologists neurochemists and researchers dealing with physiological acoustics and the psychophysics of the visual system

Sensory Processes at the Neuronal and Behavioral Levels Alexander W. Astin, 1971 *The Neural Bases of Multisensory Processes* Micah M. Murray, Mark T. Wallace, 2011-08-25 It has become accepted in the neuroscience community that perception and performance are quintessentially multisensory by nature Using the full palette of modern brain imaging and neuroscience methods *The Neural Bases of Multisensory Processes* details current understanding in the neural bases for these phenomena as studied across species stages

Neural Mechanisms of Goal-Directed Behavior and Learning Richard B. Thompson, 2012-12-02 *Neural Mechanisms of Goal Directed Behavior and Learning* provides information pertinent to the neuronal mechanisms of motivation and learning This book focuses on the theoretical frameworks within which researchers analyze specific problems Organized into six parts encompassing 39 chapters this book begins with an overview of the problem of goal directed behavior that occupies a central position in psychology This text then examines the behavioral investigations that are directed at delineating the role of contiguity and determining the possible mechanisms of reinforcement in classical defense and reward conditioning Other chapters consider the homeostatic regulation of various functions such as nutrition temperature respiration blood pressure and fluid and electrolyte balance This book discusses as well the effects of experimental treatments on memory The final chapter deals with the relationship between perception and memory This book is a valuable resource for psychologists and scientists Graduate students in behavioral neuroscience will also find this book useful

Basic Mechanisms in Hearing Aage Møller, 2012-12-02 *Basic Mechanisms in Hearing* is a collection of papers that discusses the function of the auditory system covering its ultrastructure physiology and the mechanism's connection with experimental psychology Papers review the mechanics morphology and physiology of the

cochlear including the physiology of individual hair cells and their synapses One paper examines the combined physiological and anatomical studies of stimulus coding in the mammalian auditory nervous system The results of these studies pertain to the latency frequency selectivity and time pattern of responses to short tone bursts Other research compare the cochlear nerve behavioral and psychophysical frequency selectivity which show that frequency selectivity of the auditory system occurs at the level of the cochlear nerve becoming downgraded in end organ deafness Other papers discuss neural coding at higher levels such as the feature extraction in the auditory system of bats Some papers also analyze the specialized hearing mechanisms in animals for example the echolocation of bats and in some insects the function of the swimbladder in fish hearing as well as the invertebrate frequency analyzer in the locust ear Physiologists neurophysiologists neurobiologists general medical practitioners and ENT specialists will find this collection valuable

The Intersection of Cognitive, Motor, and Sensory Processing in Aging: Links to Functional Outcomes, volume II Jeannette R. Mahoney, Uros Marusic, 2024-01-25 Given the success of the previous edition of this Research Topic we are pleased to announce the release of its second volume Age related changes can concurrently affect cognitive motor and sensory functioning and their interactions For instance age related unisensory impairments have been linked to slower gait functional mobility decline increased risks of falls and reduced quality of life Additionally balance impairments have been associated with inefficient interactions between musculoskeletal and sensory systems which are often compromised in aging Lastly inefficient multisensory integration processes have been linked to increased falls worse balance slower gait and increased cognitive impairments Consequently the successful interaction among sensory motor and cognitive systems are an integral aspect for everyday life activities which commonly deteriorate with age

Handbook of the Behavioral Neurobiology of Serotonin, 2020-01-23 Handbook of the Behavioral Neurobiology of Serotonin Second Edition builds on the success of the first edition by continuing to provide a detailed and comprehensive overview of the many facets of behavioral serotonin research The text expands on the two key topics behavioral control sensory processing ultrasonic vocalization and melatonin and sleep control and psychiatric disorders including its role on psychostimulant abuse and addiction The new edition includes two new sections on the serotonin systems interactions and the involvement of serotonin in neurological disorders and associated treatment Serotonin is a major neurotransmitter in the serotonergic system which one of the best studied and understood transmitter systems Both are critically involved in the organization of all behaviors and in the regulation of emotion and mood Features two new sections on serotonin systems interactions and serotonin in neurological disorders Focuses on ionotropic and metabotropic 5 HT receptor involvement in behavior Maps receptors and

accept inputs from and act upon their surroundings The main focus is on the way animals and artificial systems process information about their surroundings in order to move and act adaptively The analysis of the collective properties of systems of interacting agents however is a problem that occurs repeatedly in many disciplines Therefore contributions from a wide variety of areas have been included in order to obtain a broad overview of phenomena that demonstrate complexity arising from simple interactions or can be described as adaptive behavior arising from the collective action of groups of agents To this end we have invited contributions on topics ranging from the development of complex structures and functions in systems ranging from cellular automata genetic codes and neural connectivity to social behavior and evolution Additional contributions discuss traditional concepts of intelligence and adaptive behavior 1

Emotion and Behavior Fritz Strack, Paul Pauli, Peter Weyers, 2016-09-16 In this Research Topic several groups of researchers from both social and biological psychology summarize their findings addressing the relation between emotion and behavior The Reflective Impulsive Model RIM Strack 2014 in press serves as a general orientation and provides a link to integrate the results from seemingly divergent perspectives The contributions focus on different types of emotional behaviors like facial expressions and impulsive reactions They address the central issue of approach vs avoidance and include clinical topics like addiction and fear Methodologically the contributions are predominantly experimental and are partly based on manipulations in the context of virtual reality

Neural Systems: Analysis and Modeling Frank H. Eeckman, 2012-12-06 In recent years there has been tremendous activity in computational neuroscience resulting from two parallel developments On the one hand our knowledge of real nervous systems has increased dramatically over the years on the other there is now enough computing power available to perform realistic simulations of actual neural circuits This is leading to a revolution in quantitative neuroscience which is attracting a growing number of scientists from non biological disciplines These scientists bring with them expertise in signal processing information theory and dynamical systems theory that has helped transform our ways of approaching neural systems New developments in experimental techniques have enabled biologists to gather the data necessary to test these new theories While we do not yet understand how the brain sees hears or smells we do have testable models of specific components of visual auditory and olfactory processing Some of these models have been applied to help construct artificial vision and hearing systems Similarly our understanding of motor control has grown to the point where it has become a useful guide in the development of artificial robots Many neuroscientists believe that we have only scratched the surface and that a more complete understanding of biological information processing is likely to lead to technologies whose impact will propel another industrial revolution Neural Systems Analysis and Modeling contains the collected papers of the 1991 Conference on Analysis and Modeling of Neural Systems AMNS and the papers presented at the satellite symposium on compartmental modeling held July 23-26 1992 in San Francisco California The papers included present an update of the most recent developments in quantitative analysis and modeling techniques for the study of neural systems

The New Handbook of Multisensory Processing Barry E. Stein, 2012-06-01 The major reference work for a rapidly advancing field synthesizes central themes reports on current findings and offers a blueprint for future research Scientists attempt to understand the physiology underlying our

apprehension of the physical world was long dominated by a focus on the individual senses. The 1980s saw the beginning of systematic efforts to examine interactions among different sensory modalities at the level of the single neuron. And by the end of the 1990s a recognizable and multidisciplinary field of multisensory processes had emerged. More recently studies involving both human and nonhuman subjects have focused on relationships among multisensory neuronal ensembles and their behavioral, perceptual, and cognitive correlates. The New Handbook of Multisensory Processing synthesizes the central themes in this rapidly developing area, reports on current findings, and offers a blueprint for future research. The contributions, all of them written for this volume by leading experts, reflect the evolution and current state of the field. This handbook does more than simply review the field. Each of the volume's eleven sections broadly surveys a major topic, and each begins with a substantive and thought-provoking commentary by the section editor that identifies the major issues being explored, describes their treatment in the chapters that follow, and sets these findings within the context of the existing body of knowledge. Together, the commentaries and chapters provide an invaluable guide to areas of general agreement, unresolved issues, and topics that remain to be explored in this fast-moving field.
