

# Brain peptides

Within the past decade, a large number of peptides have been described within the vertebrate central nervous system. Some of these peptides were previously known to be present in nonneural vertebrate tissues, as well as in lower species, in which they may serve as primitive elements of intercellular communication prior to the development of neuronal or endocrine systems. In vertebrates, these peptides are thought to have neurotransmitter or neuromodulatory roles and appear to be involved in the regulation of a number of homeostatic systems, although the mechanisms of their actions are still unclear.

Seeley, 1999-10-25 When an excessive proportion of the human energy requirement is derived from fat the likelihood of obesity increases Any such individual is at risk for diabetes and cardiovascular disease grave and costly health hazards The selective control of fat ingestion is a promising solution to these concerns Existing data suggests that macronutrient intake can be manipulated Further research is working to create pharmacological tools that will suppress fat consumption It will also be possible to fight obesity heart disease and diabetes Neural and Metabolic Control of Macronutrient Intake systematically discusses the known physiological mechanisms involved in macronutrient selection including their molecular genetic and neurochemical aspects The book is also a critical review of the hypothesis that ingestion of the three nutrients is regulated by separate neural control mechanisms leaving open the possibility that strategies could be devised to intervene in bodily control systems and alter the proportion of fat in the diet This reference provides three types of information First the basic background of the biochemical and physiological systems as they relate to macronutrient selection Second opinions and data concerning to what degree animals and humans show evidence of macronutrient selection And third evidence about how the central nervous system might be involved in the choices animals make among macronutrients      *Biomedical Index to PHS-supported Research*, 1990      *Index Medicus*, 2004 Vols for 1963 include as pt 2 of the Jan issue Medical subject headings      *Research Grants Index* National Institutes of Health (U.S.). Brain diseases are among the major disorders influencing human health In general brain diseases include diseases that might be classified as neurological or psychiatric for example Alzheimer's disease Parkinson's disease epilepsy depression autism and addiction Patients with these types of diseases are mainly characterized by abnormal thinking patterns cognition emotional states and behavior To date much of the research on these diseases has used animal models Despite some encouraging findings the underlying pathophysiology of these diseases is still relatively unclear In particular whether some findings are causal accompanying or simply irrelevant to the occurrence of brain diseases has great significance for the development of more effective treatments In this respect there is a recognized need for more updated perspectives from preclinical investigations in animal models It is worth mentioning that since it was first reported in 2011 the reduction of anxiety like behavior and the changes of neurochemicals in the brain were observed in mice with the absence of gut microbes resulting in a surge of interest in the role of the gut microbiota in health And the new concept of microbiota gut brain MGB axis was formally put forward in 2012 which revealed the ways in which peripheral systems and organs affect the brain and showed that the periphery and the center can be closely linked through the carriers of gut microbiota After more than a decade of development animal models provide an important vehicle for exploring the role of gut microbiota in the pathology of brain diseases potential therapeutic approaches and diagnostic tools However extending these findings to the diagnosis and treatment of human brain diseases still faces great challenges
