and Cognition Leonard F. Koziol,Deborah Ely Budding,2009-04-21 Clinical psychologists and neuropsychologists are traditionally taught that cognition is mediated by the cortex and that subcortical brain regions mediate the coordination of movement However this argument can easily be challenged based upon the anatomic organization of the brain The relationship between the prefrontal cortex frontal lobes and basal ganglia is characterized by loops from these anterior brain regions to the striatum the globus pallidus and the thalamus and then back to the frontal cortex There is also a cerebrocerebellar system defined by projections from the cerebral cortex to the pontine nuclei to the cerebellar cortex and deep cerebellar nuclei to the red nucleus and then back to thalamus and cerebral cortex including all regions of the frontal lobes Therefore both the cortical striatal and cortical cerebellar projections are anatomically defined as re entrant systems that are obviously in a position to influence not only motor behavior but also cognition and affect This represents overwhelming evidence based upon neuroanatomy alone that subcortical regions play a role in cognition The first half of this book defines the functional neuroanatomy of cortical subcortical circuitries and establishes that since structure is related to function what the basal ganglia and cerebellum do for movement they also do for cognition and emotion The second half of the book examines neuropsychological assessment Patients with lesions restricted to the cerebellum and or basal ganglia have been described as exhibiting a variety of cognitive deficits on neuropsychological tests Numerous investigations have demonstrated that higher level cognitive functions such as attention executive functioning language visuospatial processing and learning and memory are affected by subcortical pathologies There is also considerable evidence that the basal ganglia and cerebellum play a critical role in the regulation of affect and emotion These brain regions are an integral part of the brain s executive system The ability to apply new methodologies clinically is essential in the evaluation of disorders with

subcortical pathology including various developmental disorders broadly defined to include learning disorders and certain psychiatric conditions for the purpose of gaining greater understanding of these conditions and developing appropriate methodologies for treatment The book is organized around three sources of evidence neuroanatomical connections patients with various disease processes experimental studies including various imaging techniques These three sources of data present compelling evidence that the basal ganglia and cerebellum are involved in cognition affect and emotion The question is no longer if these subcortical regions are involved in these processes but instead how they are involved The book is also organized around two basic concepts 1 the functional neuroanatomy of the basal ganglia and the cerebellum and 2 how this relates to behavior and neuropsychological testing Cognitive neuroscience is entering a new era as we recognize the roles of subcortical structures in the modulation of cognition The fields of neuropsychology cognitive psychology neuropsychiatry and neurology are all developing in the direction of understanding the roles of subcortical structures in behavior This book is informative while defining the need and direction for new paradigms and methodologies for neuropsychological assessment

Epilepsy and Alzheimer's disease: shared pathology, clinical presentations, and targets for treatment

Beth Leeman-Markowski, Jeannie Chin, Dominique Leitner, Keith Vossel, 2024-09-30 Emerging data suggest a link between Alzheimer's disease AD and epilepsy AD and other dementias pose increased risk for seizures with seizure incidence in AD up to ten times greater than in age matched controls Mouse models of AD also demonstrate seizures and abnormal spikes or sharp wave discharges interictal epileptiform discharges IEDs on electroencephalography EEG Seizures and IEDs may underlie fluctuating cognitive abilities in AD with the impact of antiseizure medication ASM requiring further investigation

Many epilepsy patients have memory and other cognitive deficits due to multiple factors. Most adult onset epilepsy occurs in people 60 years of age and epilepsy patients are at increased risk of developing dementia. Hyperphosphorylated tau and amyloid deposits were found in resected temporal lobe tissue of epilepsy patients similar to AD and increased total and phosphorylated tau levels in the cerebrospinal fluid may predict the onset of AD and other dementias. The mechanisms underlying the associations between AD, epilepsy, tau deposition and beta amyloid plaques and their relationships to clinical features are unknown. Some epilepsy patients develop dementia and some AD patients develop seizures while others do not. Analyses of resected tissue in epilepsy patients also suggest variable amyloid and tau deposition across patients and studies. Who is at risk? What does shared pathology indicate regarding disease development, progression and treatment? Better understanding of the associations between epilepsy and dementia with respect to epidemiology, pathophysiology, genetics, clinical presentations and treatment approaches based on animal models and human studies is needed to optimize patient care. Insight into the relationship between epilepsy and AD requires various approaches including tissue analysis, imaging, genetic techniques, cognitive testing and electroencephalography in animals and humans. We welcome manuscripts that span these approaches including original research articles, brief research articles, clinical trials, case reports, reviews, systematic reviews, mini reviews, methods articles, hypothesis and theory articles, perspectives and opinions. Themes may include: Diagnosis e.g. seizure or interictal discharge detection in dementia patients, distinguishing comorbid dementia from epilepsy related cognitive dysfunction; Epidemiology e.g. incidence and prevalence of comorbid AD and epilepsy, occurrence of epilepsy in other dementias, seizure types, age or stage of onset; Genetic risk factors; Pathophysiology underlying seizure generation in AD and cognitive decline in epilepsy; Treatment approaches e.g. effects of ASMs on cognitive decline, impact of disease modifying AD treatments on seizures, neurostimulation. What can be learned from other disorders in which cognitive deficits and seizures are common i.e. traumatic brain injury.

Inside Out and Outside In Joan Berzoff, Laura Melano Flanagan, Patricia Hertz, 2021-04-08 *Inside Out and Outside In* has established itself as a foundational book for mental health practitioners in a variety of disciplines who work with clients in complex social environments. It is unique in its focus on the forces that shape people from within and also from their social worlds with sensitivity to race, gender, sexuality and class. The fifth edition features new material and revisions throughout while maintaining the respectful and accessible style for which the book is known. It has been fully updated to reflect the changing political and social landscape regarding women's issues, immigration issues and racism to name just a few. Two new chapters have been added on Biopsychosocial Assessment and Neurobiology. In addition, the authors reinforce intersectionality and diversity through case studies in every chapter. The fifth edition of *Inside Out and Outside In* is an up to date and essential resource for mental health professionals and students practicing in today's increasingly complex environment.

In Defense of an Evolutionary Concept of Health Mahesh Ananth, 2017-11-30 One of the most controversial contemporary debates on the concept of health is the clash between the

views of naturalists and normativists Naturalists argue that although health can be valued or disvalued the concept of health is itself objective and value free In contrast normativists argue that health is a contextual and value laden concept and that there is no possibility of a value free understanding of health This debate has fueled many of the often very acrimonious disputations arising from the claims of health disease and disability activists and charities and the public policy responses to them In responding to this debate Ananth both surveys the existing literature with special focus on the work of Christopher Boorse and argues that a naturalistic concept of health drawing on evolutionary considerations associated with biological function homeostasis and species design is defensible without jettisoning norms in their entirety **Transactions of the ...**
