The high dynamic range imaging pipeline Gabriel Eilertsen,2018-05-15 Techniques for high dynamic range HDR imaging make it possible to capture and store an increased range of luminances and colors as compared to what can be achieved with a conventional camera This high amount of image information can be used in a wide range of applications such as HDR displays image based lighting tone mapping computer vision and post processing

operations HDR imaging has been an important concept in research and development for many years. Within the last couple of years it has also reached the consumer market e.g. with TV displays that are capable of reproducing an increased dynamic range and peak luminance. This thesis presents a set of technical contributions within the field of HDR imaging. First, the area of HDR video tone mapping is thoroughly reviewed, evaluated, and developed upon. A subjective comparison experiment of existing methods is performed, followed by the development of novel techniques that overcome many of the problems evidenced by the evaluation. Second, a large-scale objective comparison is presented which evaluates existing techniques that are involved in HDR video distribution. From the results, a first open source HDR video codec solution, Luma HDRv, is built using the best performing techniques. Third, a machine learning method is proposed for the purpose of reconstructing an HDR image from one single exposure, low dynamic range (LDR) image. The method is trained on a large set of HDR images using recent advances in deep learning, and the results increase the quality and performance significantly as compared to existing algorithms. The areas for which contributions are presented can be closely interlinked in the HDR imaging pipeline. Here, the thesis work helps in promoting efficient and high quality HDR video distribution and display as well as robust HDR image reconstruction from a single conventional LDR image.

Advances in Imaging and Electron Physics, 2015-06-09. *Advances in Imaging and Electron Physics* merges two long running serials *Advances in Electronics and Electron Physics* and *Advances in Optical and Electron Microscopy*. The series features extended articles on the physics of electron devices, especially semiconductor devices, particle optics at high and low energies, microlithography, image science, and digital image processing, electromagnetic wave propagation, electron microscopy, and the computing methods used in all these domains. Contributions from leading authorities inform and update on all the latest developments in the field.

Advanced High Dynamic Range Imaging Francesco Banterle, Alessandro Artusi, Kurt Debattista, Alan Chalmers, 2017-07-28. This book explores the methods needed for creating and manipulating HDR content. HDR is a step change from traditional imaging, more closely matching what we see with our eyes. In the years since the first edition of this book appeared, HDR has become much more widespread, moving from a research concept to a standard imaging method. This new edition incorporates all the many developments in HDR since the first edition and once again emphasizes practical tips, including the authors' popular HDR Toolbox available on the authors' website for MATLAB, and gives readers the tools they need to develop and experiment with new techniques for creating compelling HDR content.

Key Features: Contains the HDR Toolbox for readers' experimentation on authors' website. Offers an up-to-date detailed guide to the theory and practice of high dynamic range imaging. Covers all aspects of the field, from capture to display. Provides benchmarks for evaluating HDR imagery.
