Microbial Control Of Weeds:

Microbial Control of Weeds D.O. TeBeest, 2012-12-06 It is appropriate at this time to reflect on two decades of research in biological control of weeds with fungal plant pathogens. Some remarkable events have occurred in the last 20 years that represent a flurry of activity far beyond what could reasonably have been predicted. In 1969 a special topics review article by C. L. Wilson was published in *Annual Reviews of Phytopathology* that examined the literature and the potential for biological control of weeds with plant pathogens. In that same year experiments were conducted in Arkansas that determined whether a fungal plant pathogen could reduce the infestation of a single weed species in rice fields. In Florida a project was under way to determine the potential use of a soil borne plant pathogen as a means for controlling a single weed species in citrus groves. Work in Australia was published that described experiments that sought to determine whether a pathogen could safely and deliberately be imported and released into a country to control a weed of agricultural importance. All three projects were successful in the sense that *Puccinia chondrillina* was released into Australia to control rush skeleton weed and was released later into the United States as well and that *Colletotrichum gloeosporioides* f. sp. *aeschynomene* and *Phytophthora palmivora* were later both marketed for the specific purpose of controlling specific weed species. **Handbook of Biological Control**

T. W. Fisher, Thomas S. Bellows, L. E. Caltagirone, D. L. Dahlsten, Carl B. Huffaker, G. Gordh, 1999-09-20 For many years the use of chemical agents such as pesticides and herbicides has been effective in controlling the many varieties of pests that infest both agricultural crops and backyard gardens. However, these pests are gradually becoming resistant to these agents because the agents themselves are acting as selective factors making the pests better and better able to resist and persist. As a result, the use of biological controlling agents is increasing. This book is a comprehensive and authoritative handbook of biological control. Fungi As Biocontrol Agents T. M. Butt, C. Jackson, N. Magan, 2001 There is increasing interest in the use of fungi for the control of pests, weeds, and diseases. This book brings together perspectives from pathology, ecology, genetics, physiology, production technology to address the use of fungi as biological control agents. **Encyclopedia of Pest Management**
