Plant Strategies And The Dynamics And Structure Of Plant Communities Mpb 26 Paperback:

Plant Strategies and the Dynamics and Structure of Plant Communities David Tilman, 1988-03-21 In this new approach to understanding the dynamics occurring among plant populations at the community level Tilman sets forth an exciting hypothesis to aid in explaining the factors operative in vegetation change He emphasizes nutrient allocation especially nitrogen and light as a critical factor in addition to others in accounting for what is referred to as succession by most ecologists Tilman initially presents some basic concepts plant competition resource allocation and succession followed by his extensive old field experiments on the Minnesota sand plain These add support to his hypothesis concerning the role of nutrient allocation as a factor involved in vegetation change Illustrations including tables and figures greatly enhance the text A most readable book and students of vegetation science will find it a welcome addition to their libraries It also should find its way to all academic libraries since it is aimed primarily at professional plant ecologists W A Niering Connecticut College Choice Reviews

Positive Plant Interactions and Community Dynamics Francisco Pugnaire, 2010-02-09 Ever since the concept of the struggle for life became the heart of Darwin's theory of evolution biologists have studied the relevance of interactions for the natural history and evolution of organisms Although positive interactions among plants have traditionally received little attention there is now a growing body of evidence showing the ef

Plant Strategies, Vegetation Processes, and Ecosystem Properties J. Philip Grime, 2006-08-11 *Plant Strategies Vegetation Processes and Ecosystem Properties* Second Edition is a thoroughly updated and comprehensive new edition of the very successful *Plant Strategies and Vegetative Processes* which controversially proposed the existence of widely recurring plant functional types with predictable relationships to vegetation structure and dynamics This second edition uses evidence from many parts of the world to re-examine these concepts in the light of the enormous expansion in the literature Features include A new section covering all aspects of ecosystem properties New chapters on Assembling of Communities Rarification and Extinction Colonisation and Invasion Principles and methodologies of a range of international tests including case study examples Chapter summaries for a quick reference guide Index of species names Written in a very readable style this book is an invaluable reference source for researchers in the areas of plant animal and community ecology conservation and land management Written by one of the foremost authorities in the field summarising over 35 years of research A book all plant ecologists will want to read Jonathan Silvertown Department of Biological Sciences The Open University UK The coverage is outstanding and comprehensive Simon A Levin Department of Ecology and Evolutionary Biology Princeton University USA

How do plants make a living Some plants are gamblers others are swindlers Some plants are habitual spenders while others are strugglers and miserly savers Plants have evolved a spectacular array of solutions to the existential problems of survival and reproduction in a world where resources are scarce disturbances can be deadly and competition is cut throat Few topics have both captured the imagination and furrowed the brows of plant ecologists yet no topic is more important for understanding the assembly of plant communities predicting plant responses to global change and enhancing the restoration of our rapidly degrading biosphere The vast array of plant strategy models that characterize the discipline now require synthesis These models tend to emphasize either life history strategies based on demography or functional strategies based on ecophysiology Indeed this disciplinary divide between demography and physiology runs deep and continues to this today The goal of this accessible book is to articulate a coherent framework that unifies life history theory with comparative functional ecology to advance prediction in plant ecology Armed with a deeper understanding of the dimensionality of life history and functional traits we are now equipped to quantitatively link phenotypes to population growth rates across gradients of resource availability and disturbance regimes Predicting how species respond to global change is perhaps the most important challenge of our time A robust framework for plant strategy theory will advance this research agenda by testing the generality of traits for predicting population dynamics *The Study of Plant Communities* Henry John Oosting, 2003-01-01 On the Dynamics of Annual Plant Communities Julian James Sutton, 1988 *The Nature of Plant Communities* J. Bastow Wilson, Andrew D. Q. Agnew, Stephen H. Roxburgh, 2019-03-21

Most people can readily identify a forest or a grassland or a wetland these are the simple labels we give different plant communities The aim of this book is to move beyond these simple descriptions to investigate the hidden structure of vegetation asking questions such as how do species in a community persist over time What prevents the strongest species from taking over And are there rules that confer stability and produce repeatable patterns Answers to these questions are fundamental to community ecology and for the successful management of the world's varied ecosystems many of which are currently under threat In addition to reviewing and synthesising our current knowledge of species interactions and community assembly this book also seeks to offer a different viewpoint to challenge the reader and to stimulate ecologists to think differently about plant communities and the processes that shape them **Physiological Ecology of North American Plant Communities** Brain F Chabot, 1985-04-04 **Positive Interactions and Interdependence in Plant Communities** Ragan M. Callaway, 2010-10-19

This book marshals ecological literature from the last century on facilitation to make the case against the widely accepted individualistic notion of community organization It examines the idea that positive interactions are more prevalent in physically stressful conditions Coverage also includes species specificity in facilitative interactions indirect

facilitative interactions and potential evolutionary aspects of positive interactions Causes and Consequences of Plant Spatial Patterns in Natural and Experimental Great Basin Plant Communities Andrew P. Rayburn, 2011 The processes by which plant spatial patterns are formed and the effects of those patterns on plant community dynamics remain important areas of research in plant ecology Plant spatial pattern formation has been linked to many ecological processes that act to structure plant communities at different spatiotemporal scales Past studies of pattern formation are common but recent methodological advances in data collection and analysis have permitted researchers to conduct more advanced observational studies of pattern formation in space and time While studies of the effects of plant spatial patterns were formally rare they have increased in the last decade as new types of experiments and analysis have been developed to better understand the myriad effects of plant patterns on community dynamics My dissertation research examined both the causes and consequences of plant spatial patterns in the context of natural and experimental Great Basin semi arid plant communities In both cases I implemented novel methodologies for data collection experimental design and data analysis in an attempt to address current gaps in knowledge related to the processes by which plant spatial patterns are formed as well as the effect of plant spatial patterns on community dynamics The results inform both basic and applied plant ecology and set the stage for further research on the causes and consequences of plant spatial patterns in semi arid plant communities **Resource**
