Licari, 1970 **Plastic Coatings in Electronics** Terry Tgavalekos, 1985 Plastic Coatings for Electronics by Vapor Deposition J. J. Licari, 1973 **Handbook of Polymer Coatings for Electronics** James J. Licari, Laura A. Hughes, 1990-12-31 This completely revised edition remains the only comprehensive treatise on polymer coatings for electronics Since the original edition the applications of coatings for the environmental protection of electronic systems have greatly increased largely driven by the competitive need to reduce costs weight and volume The demands for high speed circuits for the rapid processing of signals and data high density circuits for the storage and retrieval of megabits of memory and the improved reliability required of electronics for guiding and controlling weapons and space vehicles have triggered the development of many new and improved coating polymers and formulations Both the theoretical aspects of coatings molecular structure of polymer types and their correlation with electrical and physical properties and applied aspects functions deposition processes applications testing are covered in the book Over 100 proprietary coating formulations were reviewed their properties collated and tables of comparative properties prepared This book is useful as both a primer and as a handbook for collecting properties data **Plastic Coatings for Electronics by Vapor Deposition** J. J. Licari, Rockwell International. Autonetics Division, 1973 **Plastic Coatings for Electronics** James J. Lica, 1970 **Plastics for Electronics** M. Goosey, 2012-12-06 Much of the progress towards ever greater miniaturisation made by the electronics industry from the early days of valves to the development of the transistor and later the integrated circuit has only been made possible because of the availability of various polymeric materials Indeed many new plastics have been developed specifically for electrical and electronic device applications and as a consequence the plastics and electronics industries have continued to grow side by side Electronic components are one of the few groups of products in which the real cost performance function has declined significantly over the years and part of the reason can be directly attributed to the availability and performance of new polymeric materials The evolution of the personal computer is a specific example where improvements in polymer based photoresists and plastic encapsulation techniques have allowed the mass production of high density memories and microprocessors at a cost which yields machines more powerful than mainframe computers of 30 years ago for little more than the price of a toy Today plastic materials are widely used throughout all areas of electrical and electronic device production in diverse applications ranging from alpha particle barriers on memory devices to insulator mouldings for the largest bushings and transformers Plastics or more correctly polymers find use as packaging materials for individual microcircuits protective coatings wire and cable insulators printed circuit board components die attach adhesives equipment casings and a host of other applications *Handbook of Electronics Manufacturing Engineering* Bernie Matisoff, 2012-12-06 This single source reference offers a pragmatic and accessible approach to the basic methods and

procedures used in the manufacturing and design of modern electronic products Providing a strategic yet simplified layout this handbook is set up with an eye toward maximizing productivity in each phase of the electronics manufacturing process Not only does this handbook inform the reader on vital issues concerning electronics manufacturing and design it also provides practical insight and will be of essential use to manufacturing and process engineers in electronics and aerospace manufacturing In addition electronics packaging engineers and electronics manufacturing managers and supervisors will gain a wealth of knowledge
