Dyscontrol: from Drug Addiction to Impulse Control Disorders Liana Fattore, Miriam Melis, 2016-04-13 Males and females exhibit discrete attitudes and skills experience dissimilar emotional and psychological needs and react differently to peer pressure lack of self realization or other personal and social expectations In addition they are differently influenced by family history and diverge in the perception of self image and health risks To complicate the matter on gender dichotomy male testosterone levels markedly vary over the course of the day while female levels of sex hormones significantly fluctuate depending upon the menstrual cycle the pre or post menopausal age and the use of oral contraceptives All of these factors interact with genetic background and sex hormonal fluctuations and determine the differences observed in their predisposition to develop an addiction This term is traditionally associated to the abuse of legal and illegal substances However a compulsion toward the engagement in a non drug related rewarding behavior usually involving a natural reward also activates the brain reward system and engenders persistent behavior thus resulting in a diminished control over it These latter behaviors are defined as behavioral addictions This definition encompasses any behavior characterized by the followings i feeling of tension or arousal before the action ii gratification and or relief at the time of performing the act iii inability to resist an urge or drive even against great obstacles or dangers iv absence of consideration for the negative consequences that may affect family friends and or work As such behavioral addictions include compulsive food intake and sexual activity pathological gambling and Internet addiction excessive exercising compulsive buying and pyromania These behaviors which are often classified as impulse control disorders result in actions that are harmful to oneself and or others share common features e g compulsiveness impulsivity impaired decision making craving tolerance withdrawal high rates of relapse and involve dysfunction of several brain circuits Derangement from functional neurobiological mechanisms underpinning both sensitivity to reward and inhibitory control can also lead to compulsive behaviors For instance pathological gambling and other impulse control disorders e g hypersexuality compulsive painting eating and buying are often reported in Parkinson s disease patients Gender dependent differences in the rate of initiation and frequency of misuse of addicting drugs have been widely described Yet men and women also differ in their propensity to become addicted to other rewarding stimuli e g sex food or activities e g gambling exercising The goal of the present Research Topic is to explore and summarize current evidence for gender and sex differences not only in drug addiction but also in other forms of addictive behaviors Thus it will include studies showing gender dependent differences in drug addiction food addiction compulsive sexual activity pathological gambling Internet addiction and physical exercise addiction Psychiatric comorbidity potential risk factors and the underlying neural mechanisms will be also examined with particular emphasis to the role of sex hormones in modulating addictive and compulsive behaviors

Psychobiological Aspects of Sex Differences in Behavior Gail Ann Fosshage Stevens, 1977 *From Sex Differences in Neuroscience to a Neuroscience of Sex Differences: New Directions and Perspectives* Belinda Pletzer, 2015 This research topic aims to integrate scattered findings on sex differences in neuroscience

into a broader theory of how the human brain is shaped by sex and sex hormones in order to cause the great variety of sex differences that are commonly observed. It can be assumed that these differences didn't occur arbitrarily but that they rather determined and still determine evolutionary success of individuals and were shaped by the processes of natural and in particular sexual selection. Therefore sex differences are not negligible and sex difference research cannot be discriminating against one sex or the other. In fact a better understanding of the underlying causes of sex differences has great advantages for both men and women and society as a whole not only in terms of health care but in every aspect of life. Gender equality can only work out if it is equally well understood for men and women what their individual resources and needs are. Therefore it is of great importance to pave the way for identifying the underlying principles of structural and functional brain organization that cause men and women to act, think and feel differently. To this end it is of particular interest to identify possible similarities and interrelations between sex differences that did so far stand separately in order to investigate whether they share a common source. To understand where a specific sex difference comes from and whether or not it is caused by the same principle as other sex differences it is necessary to explicitly link sex differences in behavior to their neuronal correlates and vice versa link sex differences in brain structure and function to their behavioral outcomes. In particular a new understanding of male and female brain functioning may arise from findings on how sex hormones interact with various neurotransmitter systems. In the past few years several findings demonstrated that women's behavior is influenced by the sex hormone fluctuations they experience naturally during their menstrual cycle to the extent that sex differences may only be detectable in one cycle phase but not another. The study of menstrual cycle dependent effects gives important hints about which sex differences are activational and which are organizational. Additionally it only recently came to attention that hormonal contraception may alter a woman's mood, cognition and behavior as a consequence of changes in brain structure and function. The underlying mechanisms are so poorly understood that it is even hard to predict whether hormonal contraception will mask or amplify sex differences in a given task. Since the oral hormonal contraceptive pill is meanwhile used by 100 million women worldwide and even by teenagers whose brains are not yet fully developed the question of how the synthetic steroids contained in hormonal contraceptives act on the brain is to be studied hand in hand with naturally occurring sex differences. This topic summarizes the current state of the art in sex difference research and gives new perspectives in terms of hypothesis generation and methodology. Both are necessary to gain a complete picture of what it is that makes a brain male or female and move towards a neuroscience of sex differences.

Sex Differences: A

Land of Confusion Zachary Elliott, 2017-11-19 It's the 21st century and we are still being told that there are no differences between men and women and that any differences we think exist are simply the result of social constructs. To claim otherwise is considered sexist and misogynistic. Sociologists point to disparities in the workforce claiming these inequalities are the result of a patriarchal society. Yet what if these disparities could be explained through men and women's own choices and

inclinations What if instead of simply resulting from the patriarchy sexism or societal imposed gender roles these differences can be explained through a multitude of factors a mix of complex and interconnected variables A look at the current scientific literature on sex differences and their origins this paper reviews data from the fields of biology psychology evolutionary behavioral science neuroendocrinology and neurology showing the complicated and nuanced nature of average sex differences between males and females *Gonadal Hormones and Sex Differences in Behavior* Sheri A.

Berenbaum,2014-10-13 As the papers in this special issue demonstrate gonadal hormones have powerful effects on the development of the brain and behavior in human beings as in other species Both androgens and estrogens affect behavior throughout development from early prenatal life through adulthood as demonstrated in studies with a variety of methods in several species The articles also describe attempts to identify the mechanisms neural and basic behavioral that mediate hormonal effects on complex human behaviors This issue testifies to the breadth and vitality of research into the ways that hormones affect the development of sex typical behavior and illustrates several important themes that have emerged in human psychoneuroendocrinology First it is now clear that hormones do affect human behavior and the important questions relate to the mechanisms and details of hormone action Second there are many ways to study hormone effects on human behavior and this issue describes these methods and their products Third traditional conceptions of hormone behavior relations have generally stood the test of time but recent developments have begun to reveal the complexity of these relations Taken as a whole the articles in this special issue are interesting and worthwhile reading in their own right but they may also act to stimulate developmental neuropsychologists to consider hormones in their own studies Biology, Society,

and Behavior Ann V. McGillicuddy-De Lisi,Richard De Lisi,2002 Applying current theory and research this book links the development of sex differences in cognition to biological foundations multiple social processes and contextual factors Areas covered include evolutionary biology neuroscience social roles and cultural contextualism and the issues of the onset causes developmental trajectories and patterns in children s and adolescents thinking problem solving academic performance and social conditions that are related to behaviors in each of these areas An edited volume with chapters by leading scholars this book is meant for use by graduate students researchers and practitioners in the fields of developmental cognitive and psychology learning and socialization biology and education Cognitive domains addressed include language and verbal abilities mathematical and quantitative abilities spatial abilities and social cognition **Gonadal Hormones and Sex**

Sex Itself Sarah S. Richardson, 2013-12-13 Human genomes are 99.9 percent identical with one prominent exception Instead of a matching pair of X chromosomes men carry a single X coupled with a tiny chromosome called the Y Tracking the emergence of a new and distinctive way of thinking about sex represented by the unalterable simple and visually compelling binary of the X and Y chromosomes Sex Itself examines the interaction between cultural gender norms and genetic theories of sex from the beginning of the twentieth century to the present postgenomic age Using methods from history philosophy and gender studies of science Sarah S Richardson uncovers how gender has helped to shape the research practices questions asked theories and models and descriptive language used in sex chromosome research From the earliest theories of chromosomal sex determination to the mid century hypothesis of the aggressive XYY supermale to the debate about Y chromosome degeneration to the recent claim that male and female genomes are more different than those of humans and chimpanzees Richardson shows how cultural gender conceptions influence the genetic science of sex Richardson shows how sexual science of the past continues to resonate in ways both subtle and explicit in contemporary research on the genetics of sex and gender With the completion of the Human Genome Project genes and chromosomes are moving to the center of the biology of sex Sex Itself offers a compelling argument for the importance of ongoing critical dialogue on how cultural conceptions of gender operate within the science of sex

The Psychology of Gender Alice H. Eagly, Anne E. Beall, Robert J. Sternberg, 2005-08-19 To what extent does gender influence our behavior thoughts and feelings How do nature and nurture interact to shape our identities as female or male And what are the effects of gender on the ways we are perceived and treated by others The second edition of this important text and reference confronts the central questions pertaining to gender differences and similarities across the lifespan Rather than focusing on a particular viewpoint the volume is carefully designed to foster comparison among different lines of psychological research and provide a broad survey of cutting edge work in the field
