, **European Workshop on Planning** Joachim Hertzberg,1991-08-28 Planning formulating a course of action and related fields like scheduling or reasoning about action have a long research tradition in artificial intelligence However there seems to have been a communications problem among European planners with many of them unaware of good work done in neighboring countries This volume contains ten papers presented at the European Workshop on Planning held in Sankt Augustin Germany March 1991 The purpose of the workshop was to provide a forum for presenting work in planning and related areas done by European researchers The papers provide a snapshot of planning research at present being done in Europe They describe work in the areas of plan generation logical approaches to planning planning under uncertainty planning with time and semantics of plans

Artificial Intelligence in Design '96 John S. Gero,Fay Sudweeks,2012-12-06 Change is one of the most significant parameters in our society Designers are amongst the primary change agents for any society As a consequence design is an important research topic in engineering and architecture and related disciplines since design is not only a means of change but is also one of the keystones to economic competitiveness and the fundamental precursor to manufacturing The development of computational models founded on the artificial intelligence paradigm has provided an impetus for much of current design research both computational and cognitive These forms of design research have only been carried out in the last decade or so and in the temporal sense they are still immature Notwithstanding this immaturity noticeable advances have been made both in extending our understanding of design and in developing tools based on that understanding Whilst many researchers in the field of artificial intelligence in design utilise ideas about how humans design as one source of concepts there is normally no attempt to model human designers Rather the results of the research presented in this volume demonstrate approaches to increasing our

understanding of design as a process **Complex Problem Solving** Peter A. Frensch, Joachim Funke, 2014-04-04 This volume presents a state of the science review of the most promising current European research and its historic roots of research on complex problem solving CPS in Europe It is an attempt to close the knowledge gap among American scholars regarding the European approach to understanding CPS Although most of the American researchers are well aware of the fact that CPS has been a very active research area in Europe for quite some time they do not know any specifics about even the most important research Part of the reason for this lack of knowledge is undoubtedly the fact that European researchers for the most part have been rather reluctant to publish their work in English language journals The book concentrates on European research because the basic approach European scholars have taken to studying CPS is very different from one taken by North American researchers Traditionally American scholars have been studying CPS in natural domains physics reading writing and chess playing concentrating primarily on exploring novice expert differences and the acquisition of a complex skill European scholars in contrast have been primarily concerned with problem solving behavior in artificially generated mostly computerized complex systems While the American approach has the advantage of high external validity the European approach has the advantage of system variables that can be systematically manipulated to reveal the effects of system parameters on CPS behavior The two approaches are thus best viewed as complementing each other This volume contains contributions from four European countries Sweden Switzerland Great Britain and Germany As such it accurately represents the bulk of empirical research on CPS which has been conducted in Europe An international cooperation started two years ago with the goal of bringing the European research on complex problem solving to the awareness of American scholars A direct result of that effort the contributions to this book are both informative and comprehensive *Robotic Vision: Technologies for Machine Learning and Vision Applications* Garcia-Rodriguez, Jose, 2012-12-31 Robotic systems consist of object or scene recognition vision based motion control vision based mapping and dense range sensing and are used for identification and navigation As these computer vision and robotic connections continue to develop the benefits of vision technology including savings improved quality reliability safety and productivity are revealed Robotic Vision Technologies for Machine Learning and Vision Applications is a comprehensive collection which highlights a solid framework for understanding existing work and planning future research This book includes current research on the fields of robotics machine vision image processing and pattern recognition that is important to applying machine vision methods in the real world Virtual Crowds Mubbasir Kapadia, Nuria Pelechano, Jan Allbeck, Norm Badler, 2022-05-31 This volume presents novel computational models for representing digital humans and their interactions with other virtual characters and meaningful environments In this context we describe efficient algorithms to animate control and author human like agents having their own set of unique capabilities personalities and desires We begin with the lowest level of footstep determination to steer agents in collision free paths Steering choices are controlled by navigation in complex environments including multi

domain planning with dynamically changing situations Virtual agents are given perceptual capabilities analogous to those of real people including sound perception multi sense attention and understanding of environment semantics which affect their behavior choices The roles and impacts of individual attributes such as memory and personality are explored The animation challenges of integrating a number of simultaneous behavior and movement demands on an agent are addressed through an open source software system Finally the creation of stories and narratives with groups of agents subject to planning and environmental constraints culminates the presentation

The Cambridge Handbook of Artificial Intelligence Keith Frankish, William M. Ramsey, 2014-06-12 An authoritative up to date survey of the state of the art in artificial intelligence written for non specialists *Geometric and Discrete Path Planning for Interactive Virtual Worlds* Marcelo

Kallmann, Mubbasir Kapadia, 2022-05-31 Path planning and navigation are indispensable components for controlling autonomous agents in interactive virtual worlds Given the growing demands on the size and complexity of modern virtual worlds a number of new techniques have been developed for achieving intelligent navigation for the next generation of interactive multi agent simulations This book reviews the evolution of several related techniques starting from classical planning and computational geometry techniques and then gradually moving toward more advanced topics with focus on recent developments from the work of the authors The covered topics range from discrete search and geometric representations to planning under different types of constraints and harnessing the power of graphics hardware in order to address Euclidean shortest paths and discrete search for multiple agents under limited time budgets The use of planning algorithms beyond path planning is also discussed in the areas of crowd animation and whole body motion planning for virtual characters

The ^AOxford Handbook of Causal Reasoning Michael Waldmann, 2017-03-30 The Oxford Handbook of Causal Reasoning offers a state of the art review of one of our most central cognitive competencies which has for a long time been neglected in cognitive psychology This Handbook provides introductions of competing theories of causal reasoning and discusses its role in various cognitive functions and domains
