Nanotechnology in Catalysis Volumes 1 and 2 Bing Zhou, Sophie Hermans, Gabor A. Somorjai, 2004. *Introduction to Nanoscale Science and Technology* Massimiliano Di Ventra, Stephane Evoy, James R. Heflin, 2004-06-30. From the reviews: A class in nanoscale science and technology is daunting for the educator who must organize a large collection of materials to

cover the field and for the student who must absorb all the new concepts This textbook is an excellent resource that allows students from any engineering background to quickly understand the foundations and exciting advances of the field The example problems with answers and the long list of references in each chapter are a big plus for course tutors The book is organized into seven sections The first nanoscale fabrication and characterization covers nanolithography self assembly and scanning probe microscopy Of these we enjoyed the section on nanolithography most as it includes many interesting details from industrial manufacturing processes The chapter on self assembly also provides an excellent overview by introducing six types of intermolecular interactions and the ways these can be employed to fabricate nanostructures The second section covers nanomaterials and nanostructures Out of its 110 pages 45 are devoted to carbon nanotubes Fullerenes and quantum dots each have their own chapter that focuses on the properties and applications of these nanostructures Nanolayer nanowire and nanoparticle composites of metals and semiconductors are briefly covered just 12 pages with slightly more discussion of specific applications The section on nanoscale electronics begins with a history of microelectronics before discussing the difficulties in shrinking transistor size further The discussion of problems leakage current hot electrons doping fluctuations etc and possible solutions high k dielectrics double gate devices could easily motivate deeper discussions of nanoscale electrical transport A chapter on molecular electronics considers transport through alkanes molecular transistors and DNA in a simple qualitative manner we found highly instructive Nanoscale magnetic systems are examined in the fourth section The concept of quantum computation is nicely presented although the discussion of how this can be achieved with controlled spin states is perhaps necessarily not clear We found the chapter on magnetic storage to be one of the most lucid in the book The giant magnetoresistive effect operation of spin valves and issues in magnetic scaling are easier to understand when placed in the context of the modern magnetic hard disk drive Micro and nanoelectromechanical systems are covered with an emphasis on the integration of sensing computation and communication Here the student can see advanced applications of lithography The sixth section nanoscale optoelectronics describes quantum dots organic optoelectronics and photonic crystals The chapter on organic optoelectronics is especially clear in its discussion of the fundamentals of this complicated field The book concludes with an overview of nanobiotechnology that covers biomimetics biomolecular motors and nanofluidics Because so many authors have contributed to this textbook it suffers a bit from repetition However this also allows sections to be omitted without any adverse effect on student comprehension We would have liked to see more technology to balance the science apart from the chapters on lithography and magnetic storage little more than an acknowledgment is given to commercial applications Overall this book serves as an excellent starting point for the study of nanoscale science and technology and we recommend it to anyone with a modest scientific background It is also a great vehicle to motivate the study of science at a time when interest is waning Nanotechnology educators should look no further

Self-Organized Nanoscale Materials Motonari Adachi, David J. Lockwood, 2006-10-31 Novel system performance through nanostructuring has been recognized in many branches of science in the last decades The requirement for inventing a new technology paradigm has created research opportunities for scientists in very wide range of disciplines In order to fully realize the tremendous potential of nanostructure science and technology the extremely important challenges today are how to exploit synthetic methods for structures regulated at the atomic scale and to construct materials across the hierarchy of length scales from the atomic to mesoscopic and or to macroscopic scale This book comprises an overview of a wide variety of different approaches towards the synthesis of nanoscale materials and the hierarchical assemblies produced from them under the common theme of self organization mechanisms via chemical and bio inspired methods The book covers many of the exciting and recent developments from basic research to applications in the field of self assembly of nanostructures that are of general interest to a broad community of established and postgraduate researchers in physics chemistry biology engineering and materials science

Supramolecular Chemistry in Biomedical Imaging Stephen Faulkner, Thorfinnur Gunnlaugsson, Gearoid O Maille, 2022-04-01 There have been many great advances in the field of biomedical imaging in recent years with

supramolecular chemistry playing a key role in the evolution of modern imaging techniques Non covalent supramolecular interactions are fundamental to countless biological processes from host guest binding to the stabilisation of complex structures Supramolecular chemistry techniques can be employed to create probes that can be targeted to either exploit or disrupt these interactions giving the potential for both diagnostic and therapeutic effects Furthermore in techniques such as contrast enhanced MRI controlling the interactions between solvent molecules and the imaging agent is crucial to the development of the technique With rapid growth in the synthesis and study of molecular imaging agents the understanding of their associated techniques has sometimes lagged behind Supramolecular Chemistry in Biomedical Imaging will fill this gap by clarifying the state of current understanding and the nature of the underlying problems inherent to addressing problems in biology It will cover both the techniques used in imaging and the molecular and supramolecular systems used to exploit them This publication targets academics coming to the field from mainstream supramolecular chemistry research graduates and undergraduates interested in supramolecular chemistry synthesis or imaging agents and imaging techniques for biomedical applications

Interfacial Nanochemistry Hitoshi Watarai, Norio Teramae, Tsugo Sawada, 2006-03-30 The history of the liquid liquid interface on the earth might be as old as that of the liquid It is plausible that the generation of the primitive cell membrane is responsible for an accidental advent of the oldest liquid interfaces since various compounds can be concentrated by an adsorption at the interface The presence of liquid liquid interface means that real liquids are far from ideal liquids that must be miscible with any kinds of liquids and have no interface Thus it can be said that the non ideality of liquids might generate the liquid liquid interface indeed and that biological systems might be generated from the non ideal interface The liquid liquid interface has been therefore studied as a model of biological membrane From pairing two phases of gas liquid and solid nine different pairs can be obtained which include three homo pairs of gas gas liquid liquid and solid solid pairs The gas gas interface however is practically no use under the ordinary conditions Among the interfaces produced by the pairing the liquid liquid interface is most slippery and difficult to be studied experimentally in comparison with the gas liquid and solid liquid interfaces as the liquid liquid interface is flexible thin and buried between bulk liquid phases Therefore in order to study the liquid liquid interface the invention of innovative measurement methods has a primary importance

Nanotechnology for Electronic Materials and Devices Anatoli Korkin, Evgeni Gusev, Jan K. Labanowski, Serge Luryi, 2010-05-07 The high level of attention and interest of

the global community to NANO science and technology to a large extent is linked to the GIGAntic challenges for the continuing growth of information technology which sparked an unprecedented level of interdisciplinary and international cooperation among industrial and academic researchers companies IT market rivals and countries including former political and military rivals Microelectronics technologies have reached a new stage in their development The latest miniaturization of electronic devices is approaching atomic dimensions interconnect bottlenecks are limiting circuit speeds new materials are being introduced into microelectronics manufacture at an unprecedented rate and alternative technologies to mainstream complementary metal oxide semiconductors CMOSs are being considered The very dynamic stage of science and technology related to the advanced and future electronics and photonics creates a growing gap between the large number of rapid publications and nanotechnology highlights in media on one side and fundamental understanding of underlying phenomena and an adequate evaluation of scientific discoveries and technological innovations on the other side Writing a tutorial book on fundamentals of science and technology for electronics at this time is almost the same level of challenge as writing a history book during a revolution
