Structure—Property Relationships in Polymers Charles E. Carraher Jr., R.B. Seymour, 2012-12-06 The first concern of scientists who are interested in synthetic polymers has always been and still is How are they synthesized But right after this comes the question What have I made and for what is it good This leads to the important topic of the structure property relations to which this book is devoted Polymers are very large and very complicated systems their characterization has to begin with the chemical composition configuration and conformation of the individual molecule The first chapter is devoted to this broad objective The immediate physical consequences discussed in the second chapter form the basis for the physical nature of polymers the supermolecular interactions and arrangements of the individual macromolecules The third chapter deals with the important question How are these chemical and physical structures experimentally determined The existing methods for polymer characterization are enumerated and discussed in this chapter The following chapters go into more detail For most applications textiles films molded or extruded objects of all kinds the mechanical and the thermal behaviors of polymers are of preponderant importance followed by optical and electric properties Chapters 4 through 9 describe how such properties are rooted in and dependent on the chemical structure More detailed considerations are given to certain particularly important and critical properties such as the solubility and permeability of polymeric systems Macromolecules are not always the final goal of the chemist they may act as intermediates reactants or catalysts This topic is presented in Chapters 10 and 11
