Studies of Sabarmati River and Kharicut Canal, Ahmedabad, Gujarat Dr. Rita N. Kumar, Dr. Rajal Solanki, Prof. Dr. Nirmal Kumar, J.I., Dr. Hiren B. Soni, The Mother Planet Earth is the only one in our solar system characterized and shaped by abundant liquid water a necessity for life Aquatic ecosystems are diverse habitats endowed with physical chemical and geographical variations in the world where the gradation from highly productive organisms to highly specialized organisms exists Although water characterizes this planet majority of it is saline in nature 97.2% and contained in the world's ocean

Only 2.8% is fresh water including 2.05% frozen in glaciers 0.68% as groundwater and only a tiny fraction 0.011% of our water resources is contained in freshwater i.e. ponds rivers and lakes This water is available first in the form of surface water through rivers and lakes The river is a prime example of lotic ecosystem It is a wide natural stream of fresh water that flows into an ocean and is usually fed by smaller streams called tributaries that enter it along its course A river and its tributaries form a drainage basin or watershed that collects the run off throughout the region and channels along with erosional sediments toward the river Rivers are described by unidirectional flow continuous state of physical change high degree of spatial and temporal heterogeneity including biotic aquatic plant organisms and plankton as well as abiotic physical and chemical interactions There are 14 major rivers 44 medium rivers and 53 small rivers in India Major rivers have been proved to be the seat for the setup of big cities and their educational political and regional developments The Gujarat State is profusely endowed with a number of perennial rivers such as Narmada Tapi Mahi and Sabarmati The book Pollution Studies of Sabarmati River and Kharicut Canal Ahmedabad Gujarat focuses on environmental ecological and biological studies of two rivers viz Sabarmati River Front and Kharicut Canal Industrial River Central Gujarat India covering abiotic hydrochemical characteristics geochemical characters nutrient budget recycling of nutrients biotic components microbial analysis Total Coliform Faecal Coliform phytoplankton zooplankton eutrophic status and heavy metals in surface water and bottom sediment The book also highlights an in depth study of surface water and bottom sediment quality diversity density abundance commonness rarity of plankton phytoplankton zooplankton including qualitative and quantitative characters diversity indices population dynamics and correlation between abiotic and biotic components The book would indubitably be a standard reference guide for riverine conservationists river managers policy makers and decision makers to prevent the unrestrained exploitation of stream biodiversity destruction of potential riverine habitats and uncontrolled interactions of man and technology with lotic ecosystems of the world

Hydrothermal and Supercritical Water Processes Gerd Brunner, 2014-04-04 Hydrothermal and Supercritical Water Processes presents an overview on the properties and applications of water at elevated temperatures and pressures It combines fundamentals with production process aspects Water is an extraordinary substance At elevated temperatures and pressures its properties change dramatically due to the modifications of the molecular structure of bulk water that varies from a stable three dimensional network formed by hydrogen bonds at low and moderate temperatures to an assembly of separated polar water molecules at high and supercritical temperatures With varying pressure and temperature water is turned from a solvent for ionic species to a solvent for polar and non polar substances This variability and an enhanced reactivity of water have led to many practical applications and to even more research activities related to such areas as energy transfer extraction of functional molecules unique chemical reactions biomass conversion and fuel materials processing destruction of dangerous compounds and recycling of useful ones growth of monolithic crystals and preparation of metallic nanoparticles This book provides an

introduction into the wide range of activities that are possible in aqueous mixtures It is organized to facilitate understanding of the main features outlines the main applications and gives access to further information Summarizes fundamental properties of water for engineering applications Compares process and reactor designs Evaluates processes from thermodynamic economic and social impact viewpoints

Love Thyself Masaru Emoto,2006-02-01 The common language that the people of the world have been seeking is found in water crystals Water speaks for what is in our mind Water awakens the subconscious memory in each person I now know why water is indispensable to the phenomenon of life and why alternative therapies exist and why they are effective Water helped me understand religion and prayer and gave me a clue to understanding the nature of energy It helped me understand the relationship between humanity and the cosmos It gave me a clue to help me understand what dimensionality is I could come one step closer to understanding the eternal theme of humanity that asks where we come from why we are here and what happens when we die Thus for the release of this the third volume in my series of The Message from Water I decided to choose what the world most urgently needs at present as a theme That is of course the need to eliminate war and terrorism throughout the world The theme I have chosen is prayer When I thought about it more deeply I realized that prayer is most effectively sent when each person in the world raises their energy of love by imagining a scene where the peoples of the world are living in peace I've been taught this through the process of asking water many questions For this reason the title of this book is Love Thyself First you must shine with positive high spirited vibrations and be full of love In order to do that I think it's important to love thank and respect yourself If that's the case then each of those vibrations will be sent out into the world and the cosmos and the great symphony of that harmonic vibration will wrap our planet in waves of love that serve to cherish our Heaven granted lives This is the message from water Masaru Emoto

Marine Biology: A Very Short Introduction Philip V. Mladenov,2020-02-27 The oceans are our planet's most distinctive and imposing natural habitat They cover 71 per cent of its surface support a remarkably diverse and exquisitely adapted array of life forms from microscopic viruses bacteria and plankton to the largest existing animals and possess many of Earth's most significant intriguing and inaccessible ecosystems In an era in which humans are significantly altering the global environment the oceans are undergoing rapid and profound changes The study of marine biology is thus taking on added importance and urgency as people struggle to understand and manage these changes to protect our marine ecosystems Healthy oceans produce half of the oxygen we breathe stabilize our climate create ecosystems that protect our coasts from storms provide us with abundant food and host diverse organisms that provide us with natural products for medicine and biotechnology In this Very Short Introduction marine biologist Philip Mladenov provides an accessible and up to date overview of marine biology offering a tour of marine life and marine processes that ranges from the unimaginably abundant microscopic organisms that drive the oceans food web to the apex predators that we exploit for food from polar ocean ecosystems to tropical coral reefs and from

the luxurious kelp beds of the coastal ocean to deep ocean hydrothermal vents where life exists without the energy of the sun Throughout the book he considers the human impacts on marine life including overfishing plastic and nutrient pollution the spread of exotic species and ocean warming and acidification He discusses the threats these pose to our welfare and the actions required to put us on a path to a more sustainable relationship with our oceans so that they can be restored and protected for future generations Mladenov concludes with a new chapter offering an inspiring vision for the future of our oceans in 2050 that can be realised if we are wise enough to accelerate actions already underway and be bold with implementing new approaches The next decade will decide the state of the oceans that we leave behind for future generations
