Mad Cows And Mothers Milk The Perils Of Poor Risk Communication:

Mad Cows and Mother's Milk William Leiss, Douglas Alan Powell, 1997 Mad Cows and Mother's Milk Douglas Powell, William Leiss, 1997-10-10 The first case study deals with the mad cow fiasco of 1996 one of the most expensive and tragic examples of poor risk management in the last twenty five years For ten years the British government failed to acknowledge the possibility of a link between mad cow disease and Creutzfeldt Jakob disease the human equivalent until increased scientific evidence and public pressure forced them to take action resulting in the slaughter of more than one million cattle The second study looks at what is commonly known as hamburger disease caused by a virulent form of the E coli bacterium which has struck thousands and killed over thirty people in the last few years Despite its widespread effects it is unclear whether scientific knowledge on preventing the disease is reaching the public Other case studies include the use of a genetically engineered hormone to increase milk production in cows health risks associated with silicone breast implants public controversies surrounding dioxins and PCBs and the introduction of agricultural biotechnology These case studies show that institutions routinely fail to communicate the scientific basis of various high profile risks These failures to inform the public make it difficult for governments industry and society to manage risk controversies sensibly and often result in massive costs With its detailed analyses of specific risk management controversies *Mad Cows and Mother's Milk* will help us avoid future mistakes Mad Cows and Mother's Milk, Second Edition William Leiss, 2004-11-25 Communicating the nature and consequences of environmental and health risks is still one of the most problematic areas of public policy in Western democracies *Mad Cows and Mother's Milk* outlines the crucial role of risk management in dealing with public controversies and analyses risk communication practice and malpractice to provide a set of lessons for risk managers and communicators This second edition adds new case studies on mad cow disease in North America climate change and genetics technologies The first of the new case studies brings the story of the Bovine Spongiform Encephalopathy BSE outbreak in the United Kingdom in the 1980s up to date Mad cow disease is still being discovered in UK herds and cases of mad cow disease have been found in twenty countries across the European continent and as far away as Japan with devastating consequences for the food industry BSE has now been discovered on the North American continent in two cows born in Canada The original cause of these two new cases is almost certainly importation of infected cattle cattle feed or both from Britain Canadian government regulators and those in the cattle industry have failed to correctly assess the risks of the disease in the Canadian herd take the precautionary measures needed to prevent the spread of disease and communicate risks and precautionary measures to the public The second new study deals with global warming Not only is every aspect of this risk debate both contentious and difficult for the public to understand but the potential consequences of the risks extend all the way to global catastrophe for human civilization A new chapter outlines the many dimensions of risk debate in the context of the need for effective and sustained dialogue by an informed public The last new case study provides an introduction to genomic science

which is placed in the context of both the health benefits expected from genetic manipulation and some of the risk factors associated with it. One example is gene therapy which can be used to eliminate inherited genetic diseases i.e. cystic fibrosis, enhance human traits i.e. athletic performance and perhaps double life spans. Gene technologies are relevant to some of the most fundamental human values. This new chapter suggests that we must think about the range of new risks introduced by these technologies as well as the potential benefits and that we should do this collective thinking soon since given the furious pace of genomics discoveries the possibilities will be with us sooner than we imagine. All of the case studies emphasize the need for effective communication about risks to allow effective dialogue by informed publics on health and environmental risks.
